Test Engineering and Management

Country: United States - SIR Ranking of United States
Subject Area and Category:
- Business, Management and Accounting
- Business, Management and Accounting (miscellaneous)
- Engineering
- Mechanical Engineering
- Mechanics of Materials
- Physics and Astronomy
- Instrumentation

Publisher: Mattingley Publishing
Publication type: Trade Journals
ISSN: 0193-4120
Scope: Information not localized

The SJR is a size-independent prestige indicator that ranks journals by their 'average prestige per article'. It is based on the idea that 'all citations are not created equal'. SJR is a measure of scientific influence of journals that accounts for both the number of citations received by a journal and the importance or prestige of the journals where such citations come from. It measures the scientific influence of the average article in a journal, it expresses how central to the global scientific community a journal's average article is.

Citations per document: This indicator counts the number of citations received by documents from a journal and divides them by the total number of documents published in that journal. The chart shows the evolution of the average number of times documents published in a journal in the past two, three and four years have been cited in the current year. The two years line is equivalent to journal impact factor™ (Thomson Reuters) metric.

Total Cites: Evolution of the total number of citations and journal's self-citations received by a journal's published documents during the three previous years. Journal Self-citation is defined as the number of citations from a journal citing article to articles published by the same journal.

External Cites per Doc: Evolution of the number of total citations per document and external citation per document (i.e. journal self-citations removed) received by a journal's published documents during the three previous years. External citations are calculated by subtracting the number of self-citations from the total number of citations received by the journal's documents.

% International Collaboration: International Collaboration accounts for the articles that have been produced by researchers from several countries. The chart shows the ratio of a journal's documents signed by researchers from more than one country; that is including more than one country address.

Citable documents: Not every article in a journal is considered primary research and therefore "citable", this chart shows the ratio of a journal's articles including substantial research (research articles, conference papers and reviews) in three year windows vs. those documents other than research articles, reviews and conference papers.

Cited documents: Ratio of a journal's items, grouped in three years windows, that have been cited at least once vs. those not cited during the following year.
