ABSTRACT

This study aims to examine the effect of auditor's experience, auditor ethics, professional skepticism, and personality type of auditors on fraud detection. This research was designed using a quantitative approach. The data analysis using multiple linear regression model. There were several tests carried out prior to data analysis. The analysis prerequisite tests include tests for data validity, reliability, normality, multi colinearity, and heteroscedasticity. The research population is 156 audit board of indonesia spread across various regional entities in East Java Province which has 38 city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach. The sample in this study amounted to fifty seven auditors. The results showed that the auditor's experience has a significant effects on fraud detection, auditor ethics has a significant effects on fraud detection, professional skepticism has a significant effects on fraud detection and auditor personality type has a significant effects on fraud detection.

Keywords : auditor's ability; auditors experience; auditor ethics; professional skepticism; auditor personality type; fraud detection

INTRODUCTION

Financial statements are documents that reflect the financial performance of a company during a certain period. Government financial statements and financial statements made by companies must be based on applicable financial standards and avoid material misstatements. Material misstatements that occur in the financial statements, according to the Statement of Auditing Standards No. 70, can be caused by errors or fraud. Fraud is an error that is done intentionally with the aim of making a profit by ignoring the losses that will be received by the other party. Meanwhile, an error is an error that is done unintentionally and does not aim to gain personal gain (Zimbelman et al., 2017). Furthermore, Zimbelman et al. (2017) stated that intentional errors (fraud) that were not disclosed could have a detrimental effect on the financial reporting process itself. Therefore, the company's/government's financial statements need to be examined by an independent party from outside the company, commonly called an auditor, which aims to provide reasonable assurance that the government's/company's financial statements have been protected from material misstatement, either intentional misstatement (fraud) or unintentional misstatements (errors). Therefore, the task of an auditor is to provide assurance to interested parties that the financial statements have been prepared according to applicable standards and reflect the actual situation of a business entity.

Audit Board of the Republic of Indonesia is an institution that is given the government's power to conduct audits on government institutions. The results of the BPK audit in the Audit Results

Report are in the form of audit findings. The main considerations of opinion on the financial statements of a government agency are the fairness of the presentation of financial statement items in accordance with Government Accounting Standards, adequacy of disclosure, compliance with the provisions of laws and regulations, effectiveness of the internal control system. The results of the Unqualified Opinion from the Audit Board are not meant to guarantee that there will be no corrupt practices. However, Audit Board is required to disclose if it has found non-compliance, whether it affects or does not affect the opinion on the financial statements. It can be further explained that the findings or recommendations of the auditors given in the Unqualified Opinion report of a government agency if not followed up immediately can indicate fraud has occurred.

The phenomenon that occurred in the report on the results of the examination of the regional government financial reports of East Java Province for the 2020 fiscal year, which obtained the results: Unqualified Opinion. In the report, there are many findings / notes that need to be considered by the East Java Provincial government. The findings/records of Audit Board still finds weaknesses in internal control and problems related to non-compliance with laws and regulations, which do not materially affect the fairness of the presentation of Financial Statements for fiscal year 2020. Furthermore, other Audit Board findings/notes: (1) accountability for grant expenditures is incomplete. Such as spending on grants for street lighting assistance to community groups which are indicated to be carried out not according to the Regional Grant Agreement, namely overpayments for non-conformances in specifications and price overruns, (2) control over the implementation of Grant Expenditures in the form of unaccountable money and shortages volume of work at the Public Works Department of Highways. If Audit Board 's findings are not immediately followed up, it could indicate fraud.

Fraud can be carried out in various ways, starting from the findings of Audit Board in examining government financial statements which are seen from four things, namely: (1) the fairness of the presentation of financial statement items in accordance with Government Accounting Standards, (2) adequacy of disclosure, (3) compliance with the provisions of laws and regulations, (4) effectiveness of the internal control system. Therefore, the auditor's ability to detect findings/frauds must continue to be improved. This is because each auditor as an individual has different limitations, so the level of ability to detect findings/frauds must also be different. The limitations of the auditor can lead to a gap or expectation gap between users of auditor services (Anggriawan, 2014). Elfia & NR (2022) shows that auditor training has a positive effect on the auditor's ability to detect fraud, while time pressure and professional skepticism have no effect on the auditor's ability to detect fraud. Therefore, auditors are advised to attend training more often so that their ability to detect fraud will also improve. Several research results state that several factors can affect the auditor's ability to detect fraud. These factors include: (1) auditor experience, (2) implementation of ethical rules, (3) skepticism. Nurwahyuni & Isniawati, (2021) shows that the work experience of auditors has a significant effect on the ability to detect financial statement fraud, the professional skepticism of auditors has a significant effect on the ability to detect financial statement fraud, and professional ethics has a significant effect on the ability to detect financial statement fraud.

The first factor is the experience of the auditor. Experienced auditors will show a higher level of selective attention to relevant audit information and evidence (Hobson et al., 2015; Jaffar et al., 2011; Pratiwi et al., 2019; Suryandari & Yuesti, 2017). The experience referred to is the experience

of the auditor in conducting audits of financial statements and audit assignments in the field, both in terms of the length of time, as well as the number of audit assignments that have been carried out. (Suraida, 2005) states that in conducting an audit of financial statements, both in terms of the length of time and the number of assignments that have been handled, that the more audit experience an auditor has, the more able to produce various kinds of audits. This research is supported by research by Arsendy et al., (2017), and Adyani (2014) finding evidence that auditor experience has a positive effect on auditors' ability to detect fraud. Experienced auditors are not enough to be able to detect fraud, auditors, an auditor must also comply with the implementation of ethical rules.

The second factor that influences the auditor in detecting fraud is the implementation of the rules of ethics. Professional Ethics are norms that must be adhered to by every member of the State Audit Board as State Examiner while carrying out their duties to maintain their dignity, honor, image, and credibility. Trinanda and Waluyo (2016) found evidence that professional ethics affect the ability of auditors to detect fraud. The results of research analysis Helmiati, (2021) shows that auditor ethics has a positive and significant effect on fraud detection

The third factor that influences auditors in detecting fraud is skepticism. With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti et al., 2020; Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred. Sari et al., (2018), Indrawati et al., (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

Another factor that influences an auditor in detecting financial statements is personality type (Indrasti S. E, M. Akt & Sari, 2019; Umar et al., 2019). To detect fraud, an auditor also needs to have a personality type. Personality is a person's behavior when interacting with other people. Auditors who have a certain personality are easier to detect fraud. The personality types that are easier to detect fraud are auditors with ST and NT personalities compared to SF and NF personality types. This is because auditors who have a personality type with good senses can find fraud in the company. The ability of the auditor to detect fraud will have an impact on the provision of an opinion on the audit results. To improve its ability, the auditor must know and understand fraud, both of its kind, the characteristics of fraud and how to detect the fraud (Simanjuntak et al., 2015). Based on the description above, this study aims to test and analyze the determinants of the Auditor's Ability to Detect Fraud in Financial Statements.

THEORY REVIEW

Attribution Theory

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces (internal forces) and external forces (external forces). A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work (Kade, in Rachmawati, 2019). Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is

seen as the result of external causes that force the individual to behave (Robbins & Judge, 2013). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization.

Personality Type Theory

Jung (Yusuf and Nurihsan, 2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator (MBTI). The MBTI is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the MBTI, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types (quoted by Sample & Sample, 2017), namely:

1. The way a person focuses their attention and gains energy (Extroversion or Introversion)
2. The way a person retrieves information (Sensing or Intuition)
3. The way a person makes decisions (Thinking or Feeling)
4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Conceptual Framework

This study aims to examine the effect of auditor's experience, auditor ethics, professional skepticism, and personality type of auditors on Auditor's ability to detect fraud. the conceptual framework of this research as follows:

Figure 1. Conceptual Framework
Source: research data (2021)

Hypothesis Development

The Effect of Auditor Experience on Fraud Detection

(Faradina, (2016) states that audit experience is an experience gained from the length or number of tasks that have been handled by the auditor. Auditors who have a lot of experience will have the ability to find fraud that occurs in the company and can provide a better explanation than auditors who have no or little experience. In addition, the more auditors perform audits of financial statements, the higher the level of professional skepticism owned by the auditors. Without skepticism, even experienced auditors may not necessarily be able to find fraud in the company. The results of research conducted Kartikarini and Sugiarto (2016), Febriansyah & Novitasari, (2021), Lismawati et al., (2021), and Helmiati (2021) that auditors experience has a positive effect on fraud detection.

These results indicate that the auditor must have good audit experience when conducting an audit. Auditors who have a lot of experience can find out various audit problems in more depth, besides that auditors will find it easier to follow increasingly complex developments. Based on the description above, the following hypothesis is formulated:

H1: Auditor experience has a positive effect on detection Fraud

The Effects of Auditor Ethics on Fraud Detection

Ethics is basically related to morals that become the guide for a person or a group of nature to regulate their behavior, as well as benchmarks in assessing the goodness or badness of an action. An auditor must comply with ethical rules in carrying out his duties to facilitate the auditor in detecting fraud Gusti & Ali, (2008).

The results of the study Helmiati (2021), Pipaldi et al., (2018), dan Hassan, (2019), show that auditor ethics has a positive effect on fraud detection. This shows that if an auditor follows the regulated professional ethics, it will guarantee the quality and increase the ability to detect fraud owned by the auditor.

Khadilah et al., (2015) stated that the application of ethical rules owned by an auditor has an effect on quality audit results. The quality of the financial statements audited by an auditor is influenced by the ethical application of an auditor. Detection of fraud in the audit of the company's financial statements requires the auditor to have ethics, because ethical auditors have integrity and objectivity in carrying out their work.

Nurwiyati (2015) states that the application of ethical rules is defined as principles, rules, and moral values that are applied to regulate the behavior of an auditor in carrying out his duties. The SPKN lists three values that must be upheld by BPK members, namely independence, integrity, and professionalism. Khadilah et al., (2015) stated that the ethics of the auditor when auditing reports can affect audit results to be of higher quality. The quality of the audited financial statements can be influenced by the ethics of the auditor.

With the application of ethical rules, it is hoped that the auditor can uphold a professional attitude in carrying out his duties and comply with the applicable professional code of ethics so that the possibility of fraud by the auditor does not occur. Based on the description above, the following hypothesis is formulated:

H2: The application of ethical rules has a positive effect on detection Fraud

The Effect of Professional Skepticism on Fraud Detection

Trinanda and Waluyo (2016) states that the higher the professional skepticism of an auditor, the less likely it is that fraud will occur. Professional skills require auditors to exercise professional skepticism, namely an attitude that includes a questioning mind and an objective evaluation of the adequacy, competence, and relevance of evidence (BPK Regulation No. 1 of 2007). Professional Standards for Certified Public Accountants explain that professional skepticism is an attitude that always questions and evaluates audit evidence critically.

Umri & Islahuddin, (2015) states that the high attitude of skepticism owned by the auditor results in greater fraud that will be detected. Kartikarini & Sugiarto (2016) and Febriansyah and Novitasari (2021) shows the same result, namely that the attitude of professional skepticism has a positive influence on the ability of an auditor to detect fraud. The higher the attitude of professional skepticism that the auditor has, the more willingness or desire to find out the signs of fraud around him.

Fullerton & Durtschi, (2011) found that auditors with high skepticism will increase their ability to detect it by developing additional information searches when faced with symptoms of fraud. This finding is supported by research conducted by Faradina, (2016), Biksa and Wiratmaja (2016). An auditor is required to have an attitude of professional skepticism in carrying out his audit duties, especially for the possibility of fraud even though the fraud will not necessarily occur. Auditors who have a skeptical attitude will not immediately believe the assertions given by management. Auditors will always look for additional information and evidence that can be used to support management's assertions.

Auditors who have an attitude of professional skepticism in making decisions and providing opinions will be more careful, the auditor will also seek additional information and evidence to ensure that the audited financial statements are free from all forms of misstatement. The results of research conducted by Nurwahyuni & Isnawati, (2021), Helmiati (2021), and Lismawati et al. (2021) also found evidence that professional skepticism has a positive effect on an auditor's ability to detect fraud, because the higher the skepticism of an auditor, the higher the level of auditor's ability to detect fraud. fraud. Based on the description above, the following hypothesis is formulated:

H3: Professional Skepticism has a Positive Effect on Fraud Detection

The Effect of Personality Type Auditors on Fraud Detection

Personality types are included in internal forces, namely factors that come from within a person or individual whose abilities can personally influence their performance and behavior, so that the auditor's personality type can influence the auditor's behavior in acting. Determination of personality type in this study using the Myers Briggs Type Indicator (MBTI) which introduces 16 types of a person's personality which is a combination of four pairs of human preferences. Robbins and Judge (2013) suggest that a person's personality type can influence the decision making. Kusumawaty & Betri (2019), Kartikarini & Sugiarto (2016), Rudy et al (2017)shows personality types positively influence to financial report fraud.

Noviyanti (2008), Suryanto et al., (2017) found that auditors with ST (Sense and Thinking) and NT (Intuition and Thinking) personality types are auditors who have higher professional skepticism than auditors with other personality types. Personality with a combination type of ST and NT is a type that tends to be logical in making decisions because it considers the facts. The combination type of NT tends to emphasize patterns, contexts, and relationships with dubious and inconclusive data where in these conditions the auditor is required to guess the meaning of the data intuitively, and then use it as a basis for digging up facts with logic and objective analysis and critical in situations where decisions must be made (Tuanakotta, 2013). In the context of auditing, fraud is generally systematic or has a pattern, sometimes it is not convincing, so that to explore it, an objective and critical logic of analysis is needed. Based on this concept, it is suspected that there is an influence of the NT combination personality type that exists in the auditor on the auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H4: Personality Type Auditors has a Positive Effect on Fraud Detection

RESEARCH METHOD

Research Sample

The research population is 156 BPK auditors spread across various regional entities in East Java Province which has 38 district/city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach, namely a sampling technique that does not provide equal opportunities for each part of the population to be used as research samples (Sugiyono, 2014). In addition, the determination of the sample uses the Convenience Sampling technique, namely selecting samples from population elements (people or events) whose data is easily obtained by researchers. This sampling method was chosen based on the difficulty of the auditor's willingness to be used as a research sample. Based on these considerations, the number of samples used in this study amounted to 60 auditors who work at the BPK Representative for East Java Province. The questionnaires sent were 60 questionnaires and 57 questionnaires that could be processed while 3 questionnaires could not be processed.

Variable Operational Definition

Auditor Experience

Experience is a real activity that has been carried out by the auditor where audit experience is seen from the length of time the auditor has worked. Auditor experience in work can expand work ability. The more often a person does the same job, the more skilled and faster he gets the job done. The more kinds of work a person does, the more complex and extensive his work experience will be, and it allows for increased performance (Simanjuntak *et al.*, (2015).

In this study, the indicators used to measure the work experience variable from the research of Sukriyah et al., (2009), namely length of work, number of examination tasks, and adjusted for the addition of indicators from Agustin (2013), namely work ability, and task intensity and career development. Responses from respondents are determined on a scale of 1 to 5.

Auditor ethics

The application of ethical rules for auditors consists of principles, rules, and moral values, which are applied and must be adhered to in regulating the behavior of an auditor in carrying out their duties. The profession as an auditor is required to uphold professional ethics because auditors have responsibilities to various parties, including responsibility for the auditee, responsibility for the government, and responsibility for the community (Nurwiyati, 2015).

By applying these ethical rules, it is hoped that an auditor will be able to uphold a professional attitude and comply with the applicable professional code of ethics so that the possibility of fraud that may be carried out by the auditor will not occur. The study used three indicators of BPK's code of ethics which included integrity, professionalism and was also adjusted by adding indicators from Sukriyah et al., (2009) namely independence. Responses from respondents were determined using a Likert scale of 1 to 5.

Professional Skepticism

Professional Skepticism is an attitude that should be owned by an auditor which balances suspicion and trust. In ISA No. 200, it is said that the attitude of professional skepticism is that the auditor makes a critical assessment, with a questioning mind on the validity of the evidence obtained, is wary of the audit evidence that the auditor has obtained, is alert to audit evidence that is contradictory or contradictory. raises questions regarding reliability and documents, and also responds with questions and other information obtained from management and related parties (IFAC, 2004).

Professional skepticism is measured using indicators that have been developed by Agustin, (2013), namely critical thinking, professionalism, assumptions, accuracy, accuracy in examining the client's financial statements, understanding of audit evidence, and also adjusted for the addition of indicator, namely attitude. Responses from respondents are determined by a Likert scale of 1 to 5.

Personality type

Personality (personality) is defined by Gordon Allport (in Noviyanti, 2008) as an organic organization within the individual who has a psychological system that determines his unique adjustment to his environment. Thus, personality type is a person's adjustment to the environment according to his way. In other words, personality is the unique ways that individuals react to and interact with others. In this study, a person's personality type was measured using the Myers Briggs Type Indicator (MBTI). The indicator for the personality type variable consists of 40 question items developed by Nasution and Fitriany (2012) and Mudrika (2011). Of the 40 statement items contained in the questionnaire, 5 statement items describe each preference. The auditor is asked to choose one of the two contradictory statements between 4 pairs of preferences that correspond to the auditor's personality type. Auditors with ST (Sensing-Thinking) and NT (Intuition-Thinking) personality types were given a score of 1, and auditors with other personality types were given a score of 0.

Fraud detection

Fraud detection is a process to be able to find or disclose deviant actions that are carried out intentionally and result in misstatement of a financial statement. Fraud detection includes the identification of fraud indicators that require follow-up by the auditor to conduct an investigation.

Fraud detection in this study was measured using indicators from Koroy, (2008) developed by Simanjuntak et al., (2015) where the indicators of fraud detection are understanding the internal control system (SPI), characteristics of fraud, audit environment, audit methods, forms of fraud, and testing documentation. and personal. Responses from respondents are determined by a Likert scale of 1 to 5.

Data analysis technique

Validity test and reliability test

The data obtained from the questionnaire was tested to ensure the research data was valid and reliable.

Classic assumption test

The classical assumption tests carried out in this study were the normality test, the multicollinearity test, and the heteroscedasticity test.

Hypothesis test

Multiple linear regression analysis is used to determine the effect of more than one independent variable with the dependent variable (Sugiyono, 2014). This study examines the effect of auditor experience, auditor ethics, professional skepticism and auditor personality type affect the auditor's ability to detect fraud. The formula used is as follows:

$$PK = a + b_1PA + b_2PAE + b_3SP + b_4TK + e$$

RESULT AND DISCUSSION

Descriptive Statistics

Variable descriptive statistical tests to provide an overview of the average (mean), standard deviation, minimum value, maximum value, and number of studies are presented as follows:

Variable	N	Minimum	Maximum	Mean	Std Deviasi
Auditors experience	57	32	54	45,16	4,71
Auditor ethics	57	33	50	43,70	4,58
Professional sceptism	57	37	50	44,07	4,35
Auditor personality type	57	42	60	51,75	5,13

Table 1. Descriptive Statistic

Data Validity Test

The validity of the data was tested using the Pearson Correlation test. The following is a validity test:

Number of question	Pearson Corelation (r hitung)				r tabel	Validity
	Auditors experience	Auditor ethics	Proffesional skepticism	Auditor personal type		
1	0,81	0,60	0,82	0,81	0,260	Valid
2	0,61	0,75	0,90	0,69		Valid
3	0,87	0,77	0,86	0,76		Valid
4	0,67	0,79	0,82	0,77		Valid
5	0,74	0,78	0,84	0,80		Valid
6	0,73	0,90	0,89	0,82		Valid
7	0,66	0,90	0,80	0,77		Valid
8	0,84	0,87	0,76	0,89		Valid
9	0,82	0,83	0,68	0,84		Valid
10	0,79	0,71	0,79	0,66		Valid
11	0,62	-	-	0,84		Valid
12	-	-	-	0,75		Valid

Table 2. Validity Test Results

The results of the validity test it is known that all values of r arithmetic > r table (r table is obtained from the formula $n-2 = 57-2 = 55$ and $df(n-2) = 0.05$) then the value of r count (55;0.05) is 0.260. The table above shows that from all questions on each variable the value of r is calculated > 0.260. So it is declared valid.

Reliability Test

For reliability testing is carried out to determine whether the results of this questionnaire can be trusted or reliable. The following is a reliability test:

Variable	Cronbrach's Alpha
Auditors experience	0,84
Auditor ethics	0,93
Professional sceptism	0,94
Auditor personality type	0,94

Table 3. Reliability Test Result

From the results of the reliability test, it is known that the Cronbrach's Alpha value of auditor experience is 0.840, the Cronbrach's Alpha value of the application of ethical rules is 0.927, the Cronbrach's Alpha value of professional skepticism is 0.943, the Cronbrach's Alpha value of fraud detection is 0.942. So it can be concluded that for all variables in this study have a value greater than 0.60 then it can be declared reliable.

Classic assumption test

Normality test

This normality test uses the Kolmogorof-Smirnof test, from this test it can be seen that the residual distribution is normal or not. The following is a normality test:

Unstandardized Residual		
N		57
Normal Parameters ^{a,b}	Mean	,00000
	Std. Deviation	2,154398
Most Extreme Differences	Absolute	0,11
	Positive	0,09
	Negative	-0,11
Kolmogorov-Smirnov Z		0,85
Asymp. Sig. (2-tailed)		0,46

Table 4. Normality Test Result

Based on the Kolmogorov-Smirnov test, it has a significance value > 0.05 , the conclusion is that all data are normal.

Multicollinearity Test

Multicollinearity testing is done by looking at the VIF and Tolerance numbers. The following is a multicollinearity test:

Variable	Collinearity Statistics	
	Tolerance	VIF
Auditors experience	0,49	2,05
Auditor ethics	0,26	3,91
Professional sceptism	0,24	4,10
Auditor personality type	0,92	1,08

Table 5. Multicollinearity Test Result

The results of the multicollinearity test show that the value for tolerance is > 0.1 and $VIF < 10$. So it can be said that the data in this study is free from multicollinearity. This means that there is no correlation between the independent variables in this study.

Heteroscedasticity Test

The heteroscedasticity test assesses whether there is an inequality of variance for all residual observations from one observation to another.

Based on the glejser test, it can be seen that the four variables, namely auditor experience, application of ethical rules, professional skepticism, and personality type have a Sig value > 0.05 , so it can be concluded that there is no heteroscedasticity.

Variable	t	Sig.	Decision
Auditors experience	-1,71	0,10	No heteroscedasticity
Auditor ethics	-0,35	0,73	No heteroscedasticity
Professional sceptism	0,41	0.68	No heteroscedasticity
Auditor personality type	0,45	0,65	No heteroscedasticity

Tabel 6. Heterokedastisity Test Result

Multiple Linear Regression Analysis

The results of the multiple linear regression test that can be seen in table 11 are used as a basis for determining the behavior of the regression model using the F test, determining the coefficient of determination by looking at the value of R square/Adjusted R square and testing the hypothesis by looking at the significance value.

Variable	Coefficient	t	Sig.	Decision
constant	6,49	0,63	0,53	-
Auditors experience	0,43	4,74	0,00	H1 accepted
Auditor ethics	0,20	3,02	0,03	H2 accepted
Professional sceptism	0,70	4,99	0,00	H3 accepted
Auditor personality type	0,33	3,48	0,02	H4 accepted
R Square /Adjusted R Square	0,82 / 0,81			
Uji F	60,65			
Sig. Uji F	0,000			

Table 7. Multiple Regression Analysis Results

Goodness of fit

Goodness of fit is used to determine whether this research model is fit. In other words, Goodness of fit states the level of suitability (fit) of the research model with the ideal model for that research. Based on the table above, it shows that the test value of $F = 60.651$, with a significance level of 0.000 less than 0.05, the regression model is said to be appropriate. This shows that the regression model of this study is in accordance with the ideal model.

Coefficient of Determination Test Results (R^2)

The coefficient of determination test is used to measure how far the model's ability to explain the variation of the dependent variable is. The table above shows that the Adjusted R coefficient value is 0.810, which means that 81.0% of the fraud detection variables are influenced by the auditor's experience, application of ethical rules, personality type, and professional skepticism while the remaining 19.0% is influenced by other factors that are not included in this research model.

Results of Hypothesis Testing

Hypothesis 1, the experience of auditors has a positive effect on fraud detection. The table above shows that the significance value is $0.000 < 0.05$, so the hypothesis (H1) is accepted. The direction of the coefficient which is positive indicates that the more experienced an auditor is, the better the auditor's ability to detect fraud that occurs. The results of this study support the research of Kartikarini & Sugiarto, (2016), Febriansyah & Novitasari, (2021), Lismawati et al., (2021), and Helmiati (2021), Faradina, (2016), and Arnanda et al., (2022) which also found evidence that auditor experience has a positive effect on fraud detection.

Hypothesis 2, the auditor ethics has a positive effect on fraud detection. The table above shows a significance value of $0.030 < 0.05$, so the hypothesis (H2) is accepted. The direction of the positive coefficient indicates that if an auditor is increasingly obedient to ethical rules, especially those that are written (professional code of ethics), the easier it will be for the auditor to detect fraud. The results of this study are in line with the results of research conducted by Pipaldi et al., (2018), Hassan, (2019), and Helmiati (2021) which also found evidence that the application of ethical rules has a positive effect on fraud detection.

Hypothesis 3, professional skepticism has a positive effect on fraud detection. The table above shows a significance value of $0.000 < 0.05$, the hypothesis (H3) is accepted. The direction of the positive coefficient indicates that the more skeptical Auditor will be able to detect fraud at the audit planning stage, and will carry out the detection at the next audit stage. The results of this study are in line with the results of research conducted by Simanjuntak et al., (2015), Fullerton & Durtschi (2011), Biksa dan wiranata, (2016), Faradina (2016), Rachmawati, (2019), Nurwahyuni & Isnawati, (2021), Febriansyah & Novitasari, (2021) which found evidence that professional skepticism has an effect on against fraud detection. An audit designed with high professional skepticism will be able to provide adequate assurance to detect fraudulent financial statements or errors in financial statements. In other words, the attitude of professional skepticism can assist the auditor in evaluating evidence by conducting audit tests to obtain assurance that there may be symptoms of fraud that will occur.

Hypothesis 4, personality type of auditors has a positive effect on fraud detection. The table above shows a significance value of $0.021 < 0.05$, then the hypothesis (H4) is accepted. The direction of the positive coefficient indicates that the better the personality type of the auditor, the easier it is to detect fraud. In this study, personality types were determined using the MBTI with 4 pairs of preferences, namely: 1) Extravert (E) and Introverted (I); 2) Sensing (S) and Intuition (N); 3) Thinking (T) and Feeling (F); 4) Judging (J) and Perceiving (P). Auditors with a combination of ST and NT personality types are auditors who tend to think logically in making decisions and will consider all available facts to support their decisions. Individuals with the ST personality type process information and make decisions based on the facts obtained by using logical analysis. Meanwhile, NT processes information based on the possibilities that occur and considers them theoretically and scientifically in making decisions. The results of this study support research conducted by Kartikarini & Sugiarto (2016), Suryanto et al., (2017), Robbins & Judge, (2013), Kusumawaty & Betri (2019) which state that personality type has a positive effect on fraud detection.

CONCLUSION

This study aims to examine the effect of auditors experience, auditor ethics, professional skepticism, and personality type on the auditor's ability to detect fraud. This research was conducted at the Audit Board in East Java. Some suggestions that are expected to be taken into consideration for future researchers, among others: First, the research sample was only BPK auditors in East Java Province, so that the generalizability of the results of this study was still quite weak. Therefore, further research needs to expand the scope of the research sample in order to get better and wider research results. Second, this study develops a questionnaire model with questions and statements, so that there is a possibility of bias when respondents answer the questionnaire. Therefore, it is hoped that future research will develop a questionnaire using case examples. Finally, further research is expected to be able to develop this research by looking for other factors to detect fraud such as workload, auditor independence, time budget pressure and audit risk.

DETERMINANTS OF AUDITORS ABILITY IN FRAUD DETECTION
Cogent Business & Management

Dear wahidahwati,

Your manuscript entitled "DETERMINANTS OF AUDITORS ABILITY IN FRAUD DETECTION", which you submitted to Cogent Business & Management, has now been reviewed.

The reviews, included at the bottom of the letter, indicate that your manuscript could be suitable for publication following revision. We hope that you will consider these suggestions, and revise your manuscript.

Please submit your revision by Sep 15, 2022, if you need additional time then please contact the Editorial Office.

To submit your revised manuscript please go to <https://mc.manuscriptcentral.com/cogent> and log in. You will see an option to Revise alongside your submission record.

If you are unsure how to submit your revision, please contact us on OABM-peerreview@journals.tandf.co.uk

You also have the option of including the following with your revised submission:

- * public interest statement - a description of your paper of NO MORE THAN 150 words suitable for a non-specialist reader, highlighting/explaining anything which will be of interest to the general public
- * about the author - a short summary of NO MORE THAN 150 WORDS, detailing either your own or your group's key research activities, including a note on how the research reported in this paper relates to wider projects or issues.
- * photo of the author(s), including details of who is in the photograph - please note that we can only publish one photo

If you require advice on language editing for your manuscript or assistance with arranging translation, please do consider using the Taylor & Francis Editing Services (www.tandfeditingservices.com).

Comments to the author

Reviewer 3: 1. The introductory chapter is too long, too many different meanings, even though the author has made a special chapter on literature review, as well as introductory chapters 3 - 4 paragraphs. by providing information. 1. research problem, 2. Initial data/number of editors affected by the case/or other data that supports the problem the author expresses. 3. Previous research and the author can explain what the differences between this research and previous research are. 4. The purpose and contribution of this research.

2. I find no novelty in this article. The author emphasizes that this research is the same as previous research and this research only supports previous research? the author should describe in the introduction what is the difference between this study and previous research, why is this research important to do?

3. Some theories or understandings in the introduction should be transferred to the literature review. so that readers can quickly find out what the purpose of this research is by reading a brief, concise and clear introduction.

4. This research uses quantitative methods, I find no errors in this method. and results on this method.

5. I hope there will be further discussion about the results of the research that the author has made, not only writing that the results of this study are the same as other studies. try to have a discussion and compare with other articles.

6. I don't see any conclusion in the sentence in the conclusion chapter. The author only writes the objectives, limitations and recommendations for future research. the writer should write the conclusions of this study by looking at the problems expressed and the results obtained and the results that have been discussed.

7. The reference is very Indonesian, although research on regions in Indonesia why not compare it with research abroad for discussion? is it different culture? does it differ in government regulations?

8. In my opinion, although the author only wants to seek influence, it would be better if the author includes an in-depth discussion of the results of his research. as an example of ethical issues? does it have anything to do with culture/religion? it can be discussed by looking at references from previous research.

Comments to the author

Reviewer 7: 1. There are so many typos and terms in Indonesian. English quality is poor, please use a professional translator/corrector.
2. Abstracts can be rewritten to emphasize what happened to find out the impact of these findings and contributions
3. The way you present the results and discussion is confusing. Reduce the narrative about numbers; You can point it to the table/figure as needed without needing to be explicit. Focus on how your findings relate to existing knowledge; how your paper has helped to contribute. Place separate statistical and diagnostic evaluations before discussion. Don't mix them up.
4. In the conclusion section, you should summarize the key results of your paper and discuss practical and scientific contributions (what next?).

Review Notes

Reviewer Name : Irsyad Dhahri
Article : DETERMINANTS OF AUDITORS ABILITY IN FRAUD
DETECTION by Wahidahwati, Nur Fadrih Asyik,

Notes

1. As the first note, measuring quantities of research data using experiences, ethical perspective, sceptics and personalities issues have a huge risk as those indicators mentioned are not yet being standardly agreed upon by academic experts, and as they may be interpreted in various ways and understandings based on different perspectives. Therefore, if the author doesn't provide certain definitions on those aspects, it is better to avoid quantitatively measuring using the concept (of experiences, ethics, skepticism, and personalities) mentioned in the article.
2. Besides the language and style of the writing, the article doesn't meet the synchronized focus of the problem mentioned in the core question. In the introduction, the author mentioned that as the formal institution to conduct audits, the Audit Board of the Republic of Indonesia has issued reports mentioning findings need to be considered by the East Java Provincial government. The author mentions the records of weaknesses in internal control and problems related to laws and regulations, accountability for grant expenditures is incomplete, and control over the implementation of Grant Expenditures is losing the point when the author mentions problematic professionalism auditor to the prevention awareness of the fraud issue. Hence, the focus on the problem on the article loses its purpose. In other way, the author put the credit to the standard auditors but also questioned the professionalism of the auditor in the issue of fraud. (I might assume that the author probably address the issue of the fraud to warn the East Java Provincial government based on negative reports received).
3. Another misrepresented ways is that I agree on the factors should be possessed by auditors mentioned and explained widely within the article, but the issue should be risen up is actually 'not to rewriting auditors rules, but to analyse problems of reporting issues conducted by the East Java Province'. This will lead the article to explain how the knowledges of the institution in the standard reporting and administration issues.

Reviewer's Correction Manuscript Number: COGENTBUSINESS-2022-1150

Herewith I attach the details of the corrections from the reviewer in detail

No	Senior Editor Collins G. Ntim, PhD	Author improvements
1	Public interest statement - a description of your paper of NO MORE THAN 150 words suitable for a non-specialist reader, highlighting/ explaining anything which will be of interest to the general public	The findings of this study have implications for Attribution Theory and Personality Type Theory, attribution theory explains how a person interprets an event caused by a person's behavior. While the theory of personality types explains that personality is all real thoughts, feelings and behaviors both consciously and unconsciously. The findings of this study have implications for the policy that auditor experience, auditor ethics, professional skepticism, and auditor personality type are against fraud detection, so that the research findings are used by the government and companies as assessment policies

Previous research and the author can explain	The phenomenon that occurred in the report on the results of the examination of the regional government financial reports of East Java Province for the 2020 fiscal year, which obtained the results: Unqualified Opinion. In the report, there are many findings/ notes that need to be considered by the East Java Provincial government. The findings/records of Audit Board still finds weaknesses in internal control and problems related

<p>what the differences between this research and previous research are. 4. The purpose and contribution of this research.</p>	<p>to non-compliance with laws and regulations, which do not materially affect the fairness of the presentation of Financial Statements for fiscal year 2020. Furthermore, other Audit Board findings/notes: (1) accountability for grant expenditures is incomplete. Such as spending on grants for street lighting assistance to community groups which are indicated to be carried out not according to the Regional Grant Agreement, namely overpayments for non-conformances in specifications and price overruns, (2) control over the implementation of Grant Expenditures in the form of unaccountable money and shortages volume of work at the Public Works Department of Highways. If Audit Board 's findings are not immediately followed up, it could indicate fraud. Attribution theory was first developed by Fritz Heider 1958 in (Weiner, 2008). This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade (Rachmawati, 2019). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator,</p>

population and sample in this study were 156 Supreme Audit Boards spread across various regional entities in East Java Province consisting of 38 city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach. The sample in this study amounted to fifty-seven auditors. The results show that auditor experience has a positive and significant effect on fraud detection, auditor ethics has a positive and significant effect on fraud detection, professional skepticism has a positive and significant effect on fraud detection and auditor personality type has a positive and significant effect on fraud detection. The findings of this study are supported by Attribution Theory and Personality Type Theory.

Keywords: Auditor’s Ability, Auditors Experience, Auditor Ethics, Professional Skepticism, Auditor Personality Type, Fraud Detection

1. INTRODUCTION

It is important to do this because this study tries to compare the results of developed countries with developing countries, especially Indonesia, because in Indonesia there are still auditors who commit fraud with personal interests that have an impact on the workplace. Financial statements are documents that reflect the financial performance of a company during a certain period. Government financial statements and financial statements made by companies must be based on applicable financial standards and avoid material misstatements. Material misstatements that occur in the financial statements, according to the Statement of Auditing Standards No. 70, can be caused by errors or fraud. Fraud is an error that is done

While the theory of personality types explains that personality is all real thoughts, feelings and behaviors both consciously and unconsciously. The findings of this study have implications for the policy that auditor experience, auditor ethics, professional skepticism, and auditor personality type are against fraud detection, so that the research findings are used by the government and companies as assessment policies.</p>

**Associate Professor
Dr. Nur Fadjrih
Asyik, S.E., M.Si.,
Ak., CA**

Mada University with a degree (M.Si), a Doctoral Degree in Accounting from Brawijaya University Malang with a degree (Dr.). Research interests include financial accounting, corporate finance, corporate governance, behavioral accounting, management accounting and corporate social responsibility.

Associate Professor Dr. Nur Fadjrih Asyik, S.E., M.Si., Ak., CA. is the Chairperson of the Indonesian School of Economics (STIESIA) Surabaya Indonesia, an Assessor of BAN PT and an independent researcher. He obtained his Bachelor's degree in Accounting from Indonesia School of Economics (STIESIA) Surabaya indonesia with a degree (S.E), Master of Accounting Post graduate Program from Gadjah Mada University with a degree (M.Si), Postgraduate Program in Accounting Science with his (Dr.). Degree research interests include financial accounting, corporate finance, corporate governance, behavioral accounting, management accounting and corporate social responsibility.

intentionally with the aim of making a profit by ignoring the losses that will be received by the other party. Meanwhile, an error is an error that is done unintentionally and does not aim to gain personal gain (Zimbelman et al., 2017). Furthermore, Zimbelman et al. (2017) stated that intentional errors/ fraud that were not disclosed could have a detrimental effect on the financial reporting process itself. Therefore, the company's/government's financial statements need to be examined by an independent party from outside the company, commonly called an auditor, which aims to provide reasonable assurance that the government's/company's financial statements have been protected from material misstatement, either intentional misstatement/ fraud or unintentional misstatements (Tjaraka et al., 2022; Sudaryanto et al., 2022; Utari et al.,

2021). Therefore, the task of an auditor is to provide assurance to interested parties that the financial statements have been prepared according to applicable standards and reflect the actual situation of a business entity.

The phenomenon that occurred in the report on the results of the examination of the regional government financial reports of East Java Province for the 2020 fiscal year, which obtained the results: Unqualified Opinion. In the report, there are many findings/ notes that need to be considered by the East Java Provincial government. The findings/records of Audit Board still finds weaknesses in internal control and problems related to non-compliance with laws and regulations, which do not materially affect the fairness of the presentation of Financial Statements for fiscal year 2020. Furthermore, other Audit Board findings/notes: (1) accountability for grant expenditures is incomplete. Such as spending on grants for street lighting assistance to community groups which are indicated to be carried out not according to the Regional Grant Agreement, namely overpayments for non-conformances in specifications and price overruns, (2) control over the implementation of Grant Expenditures in the form of unaccountable money and shortages volume of work at the Public Works Department of Highways. If Audit Board 's findings are not immediately followed up, it could indicate fraud.

Attribution theory was first developed by Fritz Heider 1958 in (Weiner, 2008). This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade (Rachmawati, 2019). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by Sample & Sample, 2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Fraud can be carried out in various ways, starting from the findings of Audit Board in examining government financial statements which are seen from four things, namely: (1) the fairness of the presentation of financial statement items in accordance with Government Accounting Standards, (2) adequacy of disclosure, (3) compliance with the provisions of laws and regulations, (4) effectiveness of the internal control system. Therefore, the auditor's ability to detect findings/frauds must continue to be improved. This is because each auditor as an individual has different limitations, so the level of ability to detect findings/frauds must also be different. The limitations of the auditor can lead to a gap or expectation gap between users of auditor services (Anggriawan, 2014); Aliyyah et al., 2021; Prasetyo et al., 2021). Elfia & NR (2022) shows that auditor training

has a positive effect on the auditor's ability to detect fraud, while time pressure and professional skepticism have no effect on the auditor's ability to detect fraud. Therefore, auditors are advised to attend training more often so that their ability to detect fraud will also improve. *Several research results state that several factors can affect the auditor's ability to detect fraud. These factors include: (1) auditor experience, (2) implementation of ethical rules, (3) skepticism.* Nurwahyuni & Isniawati, (2021); Endarto et al., 2021; M. Indrawati et al., 2021) shows that the work experience of auditors has a significant effect on the ability to detect financial statement fraud, the professional skepticism of auditors has a significant effect on the ability to detect financial statement fraud, and professional ethics has a significant effect on the ability to detect financial statement fraud. *Based on the description above, this study aims to test and analyze the determinants of the Auditor's Ability to Detect Fraud in Financial Statements.*

2. LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

2.1 Attribution Theory

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Rachmawati, 2019; Prasetyo et al., 2021; Utari, Iswoyo, et al., 2021). Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Robbins & Judge, 2013; Abadi et al., 2021; Endarto, Taufiqurrahman, Suhartono, et al., 2021). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization.

2.2 Personality Type Theory

Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by (Sample & Sample, 2017; Aliyyah, Prasetyo, et al., 2021; Prasetyo, Aliyyah, Rusdiyanto, Kalbuana, et al., 2021) namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing

or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

2.3 Conceptual Framework

This study aims to examine the effect of auditor’s experience, auditor ethics, professional skepticism, and personality type of auditors on Auditor's ability to detect fraud. *the conceptual framework of this research as follows:*

Figure 1: Conceptual Framework

2.4 Hypothesis Development

2.4.1 The Effect of Auditor Experience on Fraud Detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Rachmawati, 2019; Kalbuana et al., 2021; Rusdiyanto et al., 2021). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Faradina, (2016; Kalbuana, Prasetyo, et al., 2021; Prasetyo, Aliyyah, Rusdiyanto, Nartasari, et al., 2021) states that audit experience is an experience gained from the length or number of tasks that have been handled by the auditor. Auditors who have a lot of experience will have the ability to find fraud that occurs in the company and can provide a better explanation than auditors who have no or little experience. In addition, the more

auditors perform audits of financial statements, the higher the level of professional skepticism owned by the auditors. Without skepticism, even experienced auditors may not necessarily be able to find fraud in the company. The results of research conducted [Kartikarini and Sugiarto \(2016\)](#); [Febriansyah & Novitasari, \(2021\)](#); [Lismawati et al., \(2021\)](#); [Helmiati \(2021\)](#) that auditors experience has a positive effect on fraud detection. These results indicate that the auditor must have good audit experience when conducting an audit. Auditors who have a lot of experience can find out various audit problems in more depth, besides that auditors will find it easier to follow increasingly complex developments. Based on the description above, the following hypothesis is formulated:

H1: Auditor experience has a positive effect on detection Fraud

2.4.2 The Effects of Auditor Ethics on Fraud Detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave ([Robbins & Judge, 2013](#); [Prasetyo, Aliyyah, Rusdiyanto, Chamariah, et al., 2021](#); [Prasetyo, Endarti, Endarto, Aliyyah, et al., 2021](#)). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by ([Sample & Sample, 2017](#); ([Prasetyo et al., 2021](#); [Prasetyo, Aliyyah, Rusdiyanto, Nartasari, et al., 2021b](#)), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Ethics is basically related to morals that become the guide for a person or a group of nature to regulate their behavior, as well as benchmarks in assessing the goodness or badness of an action. An auditor must comply with ethical rules in carrying out his duties to facilitate the auditor in detecting fraud ([Gusti & Ali, 2008](#); [Prabowo et al., 2020](#); [Susanto et al., 2021](#)). The results of the study ([Helmiati 2021](#); [Pipaldi et al., 2018](#); [Hassan, 2019](#)), show that auditor ethics has a positive effect on fraud detection. This shows that if an auditor follows the regulated professional ethics, it will guarantee the quality and increase the ability to detect fraud owned by the auditor. [Khadilah et al., \(2015\)](#); [Rusdiyanto, Agustia, et al., 2020](#); [Rusdiyanto, Hidayat, et al., 2020](#)) stated that the application of ethical rules owned by an auditor has an effect on quality audit results. The quality of the financial statements audited by an auditor is influenced by the ethical application of an auditor. Detection of fraud in the audit of the company's financial statements requires the auditor to have ethics, because ethical auditors have integrity and objectivity in carrying out their work. [Nurwiyati \(2015\)](#); [Yuhertiana et al., 2020, 2022](#)) states that the application of ethical rules is defined as principles, rules, and moral values that are applied

to regulate the behavior of an auditor in carrying out his duties. The SPKN lists three values that must be upheld by Audit Board of the Republic of Indonesia members, namely independence, integrity, and professionalism. *Khadilah et al., (2015; Yuhertiana, Izaak, et al., 2020; Yuhertiana, Rochmoeljati, et al., 2020)* stated that the ethics of the auditor when auditing reports can affect audit results to be of higher quality. The quality of the audited financial statements can be influenced by the ethics of the auditor.

With the application of ethical rules, it is hoped that the auditor can uphold a professional attitude in carrying out his duties and comply with the applicable professional code of ethics so that the possibility of fraud by the auditor does not occur. Based on the description above, the following hypothesis is formulated:

H2: The application of ethical rules has a positive effect on detection Fraud

2.4.3 The Effect of Professional Skepticism on Fraud Detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016; Juanamasta et al., 2019). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in (Rachmawati, 2019; Yuhertiana, Bastian, et al., 2019; Yuhertiana, Patrioty, et al., 2019). Yusuf and Nurihsan, (2008:74; Rahma et al., 2016; Tatiana & Yuhertiana, 2014) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Trinanda and Waluyo (2016; Yuhertiana, 2011b, 2011a) states that the higher the professional skepticism of an auditor, the less likely it is that fraud will occur. Professional skills require auditors to exercise professional skepticism, namely an attitude that includes a questioning mind and an objective evaluation of the adequacy, competence, and relevance of evidence (Audit Board of the Republic of Indonesia Regulation No. 1 of 2007). Professional Standards for Certified Public Accountants explain that professional skepticism is an attitude that always questions and evaluates audit evidence critically. Umri & Islahuddin, (2015; Asyik et al., 2022; Karimuna et al., 2021) states that the high attitude of skepticism owned by the auditor results in greater fraud that will be detected. Kartikarini & Sugiarto (2016; Febriansyah & Novitasari 2021; Dewianawati & Asyik, 2021) shows the same result, namely that the attitude of professional skepticism has a positive influence on the ability of an auditor to detect fraud. The higher the attitude of professional skepticism that the auditor has, the more willingness or desire to find out the signs of fraud around him.

Fullerton & Durtschi, (2011; Sadimantara et al., 2019; Wijaya et al., 2020) found that auditors with high skepticism will increase their ability to detect it by developing additional information searches when faced with symptoms of fraud. This finding is supported by research conducted by Faradina, (2016; Biksa and Wiratmaja

(2016). An auditor is required to have an attitude of professional skepticism in carrying out his audit duties, especially for the possibility of fraud even though the fraud will not necessarily occur. Auditors who have a skeptical attitude will not immediately believe the assertions given by management. Auditors will always look for additional information and evidence that can be used to support management's assertions. Auditors who have an attitude of professional skepticism in making decisions and providing opinions will be more careful, the auditor will also seek additional information and evidence to ensure that the audited financial statements are free from all forms of misstatement. The results of research conducted by (Nurwahyuni & Isnawati, 2021; Helmiati 2021; Lismawati et al. 2021) also found evidence that professional skepticism has a positive effect on an auditor's ability to detect fraud, because the higher the skepticism of an auditor, the higher the level of auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H3: Professional Skepticism has a Positive Effect on Fraud Detection

2.4.4 The Effect of Personality Type Auditors on Fraud Detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Robbins & Judge, 2013; Asyik et al., 2022; Wahidahwati & Ardini, 2021). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by (Sample & Sample, 2017; Adi et al., 2022; Sudaryanto et al., 2022), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Personality types are included in internal forces, namely factors that come from within a person or individual whose abilities can personally influence their performance and behavior, so that the auditor's personality type can influence the auditor's behavior in acting. Determination of personality type in this study using the Myers Briggs Type Indicator which introduces 16 types of a person's personality which is a combination of four pairs of human preferences. Robbins and Judge (2013; Sudaryanto et al., 2021; Utari, Sudaryanto, et al., 2021) suggest that a person's personality type can influence the decision making. (Kusumawaty & Betri 2019; Kartikarini & Sugiarto 2016; Rudy et al 2017) shows personality types positively influence to financial report fraud.

Noviyanti (2008; Suryanto et al., 2017) found that auditors with Sense and Thinking and Intuition and Thinking personality types are auditors who have higher professional skepticism than auditors with other personality types. Personality with a combination type of Sense and Thinking and Intuition and Thinking is a

type that tends to be logical in making decisions because it considers the facts. The combination type of NT tends to emphasize patterns, contexts, and relationships with dubious and inconclusive data where in these conditions the auditor is required to guess the meaning of the data intuitively, and then use it as a basis for digging up facts with logic and objective analysis and critical in situations where decisions must be made (Tuanakotta, 2013; Hanim et al., 2019; Sudaryanto et al., 2020). In the context of auditing, fraud is generally systematic or has a pattern, sometimes it is not convincing, so that to explore it, an objective and critical logic of analysis is needed. Based on this concept, it is suspected that there is an influence of the NT combination personality type that exists in the auditor on the auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H4: Personality Type Auditors has a Positive Effect on Fraud Detection

3. RESEARCH METHOD

3.1 Research Sample

The research population is 156 Audit Board of the Republic of Indonesia auditors spread across various regional entities in East Java Province which has 38 district/city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach, namely a sampling technique that does not provide equal opportunities for each part of the population to be used as research samples (Sugiyono, 2014; Putri & Sudaryanto, 2018; Sudaryanto et al., 2019). In addition, the sample uses the Convenience Sampling technique, which is choosing a sample from population elements (people or events) whose data is easy to obtain. This sampling method was chosen based on the difficulty of the auditor's willingness to be used as a research sample. analysis technique using multiple linear regression with SPSS software which is used to analyze the data in this study. One of the regression solving procedures, SPSS has a high degree of flexibility in research that relates theories, concepts, and data that can be done to the variables in the study.

3.2 Variable Operational Definition

3.2.1 Auditor Experience

Experience is a real activity that has been carried out by the auditor where audit experience is seen from the length of time the auditor has worked. Auditor experience in work can expand work ability. The more often a person does the same job, the more skilled and faster he gets the job done. The more kinds of work a person does, the more complex and extensive his work experience will be, and it allows for increased performance (Simanjuntak et al.,(2015). In this study, the indicators used to measure the work experience variable from the research of Sukriyah et al.,(2009), namely length of work, number of examination tasks, and adjusted for the addition of indicators from Agustini (2013), namely work ability, and task intensity and career development. Responses from respondents are determined on a scale of 1 to 5.

3.2.2 Auditor ethics

The application of ethical rules for auditors consists of principles, rules, and moral values, which are applied and must be adhered to in regulating the behavior of an auditor in carrying out their duties. The

profession as an auditor is required to uphold professional ethics because auditors have responsibilities to various parties, including responsibility for the auditee, responsibility for the government, and responsibility for the community (Nurwiyati, 2015). By applying these ethical rules, it is hoped that an auditor will be able to uphold a professional attitude and comply with the applicable professional code of ethics so that the possibility of fraud that may be carried out by the auditor will not occur. The study used three indicators of Audit Board of the Republic of Indonesia code of ethics which included integrity, professionalism and was also adjusted by adding indicators from Sukriyah et al., (2009) namely independence. Responses from respondents were determined using a Likert scale of 1 to 5.

3.2.3 Professional Skepticism

Professional Skepticism is an attitude that should be owned by an auditor which balances suspicion and trust. In ISA No. 200, it is said that the attitude of professional skepticism is that the auditor makes a critical assessment, with a questioning mind on the validity of the evidence obtained, is wary of the audit evidence that the auditor has obtained, is alert to audit evidence that is contradictory or contradictory. raises questions regarding reliability and documents, and also responds with questions and other information obtained from management and related parties (IFAC, 2004). Professional skepticism is measured using indicators that have been developed by Agustin, (2013), namely critical thinking, professionalism, assumptions, accuracy, accuracy in examining the client's financial statements, understanding of audit evidence, and also adjusted for the addition of indicator, namely attitude. Responses from respondents are determined by a Likert scale of 1 to 5.

3.2.4 Personality type

Personality is defined by Gordon Allport in (Noviyanti, 2008) as an organic organization within the individual who has a psychological system that determines his unique adjustment to his environment. Thus, personality type is a person's adjustment to the environment according to his way. In other words, personality is the unique ways that individuals react to and interact with others. In this study, a person's personality type was measured using the Myers Briggs Type Indicator. The indicator for the personality type variable consists of 40 question items developed by Nasution and Fitriany (2012); Mudrika (2011). Of the 40 statement items contained in the questionnaire, 5 statement items describe each preference. The auditor is asked to choose one of the two contradictory statements between 4 pairs of preferences that correspond to the auditor's personality type. Auditors with Sensing-Thinking and Intuition-Thinking personality types were given a score of 1, and auditors with other personality types were given a score of 0.

3.2.5 Fraud detection

Fraud detection is a process to be able to find or disclose deviant actions that are carried out intentionally and result in misstatement of a financial statement. Fraud detection includes the identification of fraud indicators that require follow-up by the auditor to conduct an investigation. Fraud detection in this study was measured using indicators from Koroy, (2008) developed by Simanjuntak et al., (2015) where the indicators of fraud detection are understanding the internal control system, characteristics of fraud, audit environment, audit

methods, forms of fraud, and testing documentation. and personal. Responses from respondents are determined by a Likert scale of 1 to 5.

3.3 Data Analysis Technique

3.3.1 Validity test and reliability test

The data obtained from the questionnaire was tested to ensure the research data was valid and reliable.

3.3.2 Classic assumption test

The classical assumption tests carried out in this study were the normality test, the multicollinearity test, and the heteroscedasticity test.

3.3.3 Hypothesis test

Multiple linear regression analysis is used to determine the effect of more than one independent variable with the dependent variable (Sugiyono, 2014). This study examines the effect of auditor experience, auditor ethics, professional skepticism and auditor personality type affect the auditor's ability to detect fraud. The formula used is as follows:

$$PK = a + b1PA + b2PAE + b3SP + b4TK + e$$

4. RESULT AND DISCUSSION

4.1 Descriptive Statistics

Variable descriptive statistical tests to provide an overview of the average (mean), standard deviation, minimum value, maximum value, and number of studies are presented as follows:

Table 1: Descriptive Statistic

Variable	N	Minimum	Maximum	Mean	Std Deviasi
Auditors experience	57	32	54	45,16	4,71
Auditor ethics	57	33	50	43,70	4,58
Professional sceptism	57	37	50	44,07	4,35
Auditor personality type	57	42	60	51,75	5,13

The table output variables Auditors experience above shows the number of observations (N) was 57. From these 57 observations, the Auditors experience value minimum was .32, and the Auditors experience value maximum was 54, the mean value of 57 observations or the mean was of 45,16 with a standard deviation of 4,71. The table output variables Auditor ethics above shows the number of observations (N) was 57. From these 57 observations, the Auditor ethics value minimum was .33, and the Auditor ethics value maximum was 50, the mean value of 57 observations or the mean was of 43,70 with a standard deviation of 4,58. The table output variables Professional sceptism above shows the number of observations (N) was 57. From these 57 observations, the Professional sceptism value minimum was .37, and the Professional sceptism value maximum was 50, the mean value of 57 observations or the mean was of 44,07 with a standard deviation of 4,35. The table output variables Auditor personality type above shows the number of observations (N) was 57. From these 57 observations, the Auditor personality type value minimum was .42, and the Auditor personality type value maximum was 60, the mean value of 57 observations or the mean was of 51,75 with a standard deviation of 5,13.

4.2 Data Validity Test

The validity of the data was tested using the Pearson Correlation test. The following is a validity test:

Table 2: Validity Test Results

Number of question	Pearson Correlation (r hitung)				r tabel	Validity
	Auditors experience	Auditor ethics	Professional skepticism	Auditor personal type		
1	0,81	0,60	0,82	0,81	0,260	Valid
2	0,61	0,75	0,90	0,69		Valid
3	0,87	0,77	0,86	0,76		Valid
4	0,67	0,79	0,82	0,77		Valid
5	0,74	0,78	0,84	0,80		Valid
6	0,73	0,90	0,89	0,82		Valid
7	0,66	0,90	0,80	0,77		Valid
8	0,84	0,87	0,76	0,89		Valid
9	0,82	0,83	0,68	0,84		Valid
10	0,79	0,71	0,79	0,66		Valid
11	0,62	-	-	0,84		Valid
12	-	-	-	0,75		Valid

The results of the validity test it is known that all values of r arithmetic $>$ r table (r table is obtained from the formula $n-2$, $= 57-2 = 55$ and $df (n-2) = 0.05$) then the value of r count ($55;0.05$) is 0.260. The table above shows that from all questions on each variable the value of r is calculated $>$ 0.260. So it is declared valid.

4.3 Reliability Test

For reliability testing is carried out to determine whether the results of this questionnaire can be trusted or reliable. The following is a reliability test:

Table 3: Reliability Test Result

Variable	Cronbrach's Alpha
Auditors experience	0,840
Auditor ethics	0,927
Professional sceptism	0,943
Auditor personality type	0,942

From the results of the reliability test, it is known that the Cronbrach's Alpha value of auditor experience is 0.840, the Cronbrach's Alpha value of the application of ethical rules is 0.927, the Cronbrach's Alpha value of professional skepticism is 0.943, the Cronbrach's Alpha value of fraud detection is 0.942. So it can be concluded that for all variables in this study have a value greater than 0.60 then it can be declared reliable.

4.4 Classic Assumption Test

4.4.1 Normality test

This normality test uses the Kolmogrof-Smirnof test, from this test it can be seen that the residual distribution is normal or not. The following is a normality test:

Table 4: Normality Test Result

		Unstandardized Residual
N		57
Normal Parameters ^{a,b}	Mean	,00000
	Std. Deviation	2,154398
Most Extreme Differences	Absolute	0,11
	Positive	0,09
	Negative	-0,11
Kolmogorov-Smirnov Z		0,85
Asymp. Sig. (2-tailed)		0,46

Based on the Kolmogorov-Smirnov test, it has a significance value > 0.05 (5%), the conclusion is that all data are normal.

4.4.2 Multicollinearity Test

Multicollinearity testing is done by looking at the VIF and Tolerance numbers. The following is a multicollinearity test:

Table 5: Multicollinearity Test Result

Variable	Collinearity Statistics	
	Tolerance	VIF
Auditors experience	0,49	2,05
Auditor ethics	0,26	3,91
Professional sceptism	0,24	4,10
Auditor personality type	0,92	1,08

The results of the multicollinearity test show that the value for tolerance is > 0.1 and $VIF < 10$. So it can be said that the data in this study is free from multicollinearity. This means that there is no correlation between the independent variables in this study.

4.4.3 Heteroscedasticity Test

The heteroscedasticity test assesses whether there is an inequality of variance for all residual observations from one observation to another.

Based on the glejser test, it can be seen that the four variables, namely auditor experience, application of ethical rules, professional skepticism, and personality type have a Sig value > 0.05 , so it can be concluded that there is no heteroscedasticity.

Table 6: Heterokedastisity Test Result

Variable	t	Sig.	Decision
Auditors experience	-1,71	0,10	No heteroscedasticity
Auditor ethics	-0,35	0,73	No heteroscedasticity
Professional sceptism	0,41	0,68	No heteroscedasticity
Auditor personality type	0,45	0,65	No heteroscedasticity

4.4.4 Multiple Linear Regression Analysis

The results of the multiple linear regression test that can be seen in table 11 are used as a basis for determining the behavior of the regression model using the F test, determining the coefficient of determination

by looking at the value of R square/Adjusted R square and testing the hypothesis by looking at the significance value.

Table 7: Multiple Regression Analysis Results

Variable	Coefficient	t	Sig.	Decision
constant	6,49	0,63	0,53	-
Auditors experience	0,43	4,74	0,00	H1 accepted
Auditor ethics	0,20	3,02	0,03	H2 accepted
Professional sceptism	0,70	4,99	0,00	H3 accepted
Auditor personality type	0,33	3,48	0,02	H4 accepted
R Square /Adjusted R Square	0,82 / 0,81			
Uji F	60,65			
Sig. Uji F	0,000			

4.4.5 Goodness of fit

Goodness of fit is used to determine whether this research model is fit. In other words, Goodness of fit states the level of suitability (fit) of the research model with the ideal model for that research. Based on the table above, it shows that the test value of $F = 60.651$, with a significance level of 0.000 less than 0.05 , the regression model is said to be appropriate. This shows that the regression model of this study is in accordance with the ideal model.

4.4.6 Coefficient of Determination Test Results (R^2)

The coefficient of determination test is used to measure how far the model's ability to explain the variation of the dependent variable is. The table above shows that the Adjusted R coefficient value is 0.810 , which means that 81.0% of the fraud detection variables are influenced by the auditor's experience, application of ethical rules, personality type, and professional skepticism while the remaining 19.0% is influenced by other factors that are not included in this research model.

4.5 Discussion of Research Results

4.5.1 Findings The Effect of Auditor Experience on Fraud Detection

The findings of Hypothesis 1 prove that the auditor's experience has a positive effect on fraud detection. The table above shows that the significance value is $0.00 < 0.05$ (5%), so the hypothesis (H1) is accepted, supported by the hypothesis proposed **Auditor experience has a positive effect on fraud detection**. The direction of the coefficient which is positive indicates that the more experienced an auditor is, the better the auditor's ability to detect fraud that occurs. The results of this study support the research of (Kartikarini & Sugiarto, 2016); Febriansyah & Novitasari, (2021); Lismawati et al., (2021); Helmiati (2021); Faradina, (2016); Arnanda et al., (2022) which also found evidence that auditor experience has a positive effect on fraud detection.

Experienced auditors will show a higher level of selective attention to relevant audit information and evidence (Hobson et al., 2015; Jaffar et al., 2011; Pratiwi et al., 2019; Suryandari & Yuesti, 2017). The experience referred to is the experience of the auditor in conducting audits of financial statements and audit assignments in the field, both in terms of the length of time, as well as the number of audit assignments that have

been carried out. (Suraida, 2005) states that in conducting an audit of financial statements, both in terms of the length of time and the number of assignments that have been handled, that the more audit experience an auditor has, the more able to produce various kinds of audits. This research is supported by research by Arsendy et al., (2017); Adyani (2014) finding evidence that auditor experience has a positive effect on auditors' ability to detect fraud. Experienced auditors are not enough to be able to detect fraud, auditors, an auditor must also comply with the implementation of ethical rules. Several previous studies in various countries have also stated that auditor experience has a positive influence on fraud detection and audit quality (Al-Ebel et al., 2020; Azza S. M. Gaballa, 2011; Kuntari et al., 2017). In Yemen, audit quality and fraud prevention cannot be separated from the spiritual perception of each auditor. In several other studies, the educational experience of auditors has no effect on audit quality in both Libya and Turkey (Daoust & Malsch, 2019; Ocak, 2018). However, the experience gained from abroad provides added value for the auditor (Hou et al., 2020).

These findings are supported by Attribution Theory and Personality Type Theory, *Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in (Rachmawati, 2019). while the Personality Type Theory explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by Sample & Sample, 2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)*

4.5.2 Findings The Effects of Auditor Ethics on Fraud Detection

*The findings of Hypothesis 2 prove that auditor ethics has a positive effect on fraud detection. The results from the table above show a significance value of $0.030 < 0.05$ (5%), so that the hypothesis (H2) is accepted, supported by the initial hypothesis proposed: **The application of ethical rules has a positive effect on fraud detection.** The more obedient auditors to ethical rules, especially those written (professional code of ethics), the easier it will be for auditors to detect fraud. The results of this study are in line with the results of research conducted by Pipaldi et al., (2018); Hassan, (2019); Helmiati (2021) which also found evidence that the application of ethical rules has a positive effect on fraud detection.*

Professional Ethics are norms that must be adhered to by every member of the State Audit Board as State Examiner while carrying out their duties to maintain their dignity, honor, image, and credibility. Trinanda and Waluyo (2016) found evidence that professional ethics affect the ability of auditors to detect fraud. The results of research analysis Helmiati, (2021) shows that auditor ethics has a positive and significant effect on fraud detection. Other studies also mention that auditor ethics greatly affects audit quality, including finding fraud (Haeridistia & Agustin, 2019; Kuntari et al., 2017).

These findings are supported by Attribution Theory and Personality Type Theory, *Attribution theory* was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Rachmawati, 2019). while the Personality Type Theory explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types quoted by Sample & Sample, (2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

4.5.3 Findings The Effect of Professional Skepticism on Fraud Detection

The findings Hypothesis 3 proves that professional skepticism has a positive effect on fraud detection. Results The table above shows a significance value of $0.000 < 0.05$ (5%), the hypothesis (H3) is accepted, the findings are supported by the hypothesis proposed Professional Skepticism has a Positive Effect on Fraud Detection. The direction of the positive coefficient indicates that the more skeptical Auditor will be able to detect fraud at the audit planning stage, and will carry out the detection at the next audit stage. The results of this study are in line with the results of research conducted by Simanjuntak et al., (2015); Fullerton & Durtschi (2011); Biksa & wiranata, (2016); Faradina (2016); Rachmawati, (2019); Nurwahyuni & Isnawati, (2021); Febriansyah & Novitasari, (2021) which found evidence that professional skepticism has an effect on against fraud detection. An audit designed with high professional skepticism will be able to provide adequate assurance to detect fraudulent financial statements or errors in financial statements. In other words, the attitude of professional skepticism can assist the auditor in evaluating evidence by conducting audit tests to obtain assurance that there may be symptoms of fraud that will occur.

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti et al., 2020; Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al., (2018); Indrawati et al., (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

4.5.4 Findings The Effect of Personality Type Auditors on Fraud Detection

*The findings of Hypothesis 4, the auditor's personality type has a positive effect on fraud detection. The table above shows a significance value of $0.021 < 0.05$ (5%), then the hypothesis (H4) is accepted. The findings are supported by the hypothesis proposed **Personality Type Auditors has a Positive Effect on Fraud Detection**. The direction of the positive coefficient indicates that the better the personality type of the auditor, the easier it is to detect fraud. In this study, personality types were determined using the MBTI with 4 pairs of preferences, namely: 1) Extravert (E) and Introverted (I); 2) Sensing (S) and Intuition (N); 3) Thinking (T) and Feeling (F); 4) Judging (J) and Perceiving (P). Auditors with a combination of ST and NT personality types are auditors who tend to think logically in making decisions and will consider all available facts to support their decisions. Individuals with the ST personality type process information and make decisions based on the facts obtained by using logical analysis. Meanwhile, NT processes information based on the possibilities that occur and considers them theoretically and scientifically in making decisions. The results of this study support research conducted by Kartikarini & Sugiarto (2016); Suryanto et al., (2017); Robbins & Judge, (2013); Kusumawaty & Betri (2019) which state that personality type has a positive effect on fraud detection.*

Personality type also one of the factor that influences an auditor in detecting financial statements (Indrasti & Sari, 2019; Umar et al., 2019). To detect fraud, an auditor also needs to have a personality type. Personality is a person's behavior when interacting with other people. Auditors who have a certain personality are easier to detect fraud. The personality types that are easier to detect fraud are auditors with ST and NT personalities compared to SF and NF personality types. This is because auditors who have a personality type with good senses can find fraud in the company. The ability of the auditor to detect fraud will have an impact on the provision of an opinion on the audit results. To improve its ability, the auditor must know and understand fraud, both of its kind, the characteristics of fraud and how to detect the fraud (Simanjuntak et al., 2015).

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti et al., 2020; Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al.,

(2018); Indrawati et al., (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

5. CONCLUSION

Based on the results of the analysis and discussion, it can be concluded that the auditor's experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud, meaning that the higher and lower the auditor's experience, meaning that the higher and lower the auditor's ethics, professional skepticism, and the type of auditor's ethics. personality has an impact on increasing and decreasing the ability of auditors to detect fraud. The findings are empirically supported by attribution theory and personality type theory, attribution theory explains that how a person interprets an event that causes a person's behavior is determined by internal forces while personality type theory explains that personality is all real thoughts, feelings, and behaviors that are both realized and realized. or unconsciously. The findings empirically have implications for government and company policies by looking at these findings which explain that auditor experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud. This study has limitations that cannot be avoided. Disclosure of limitations aims to make this research understandable with a non-misleading interpretation. In addition, the disclosure of limitations also has the aim that further research can fill the blank space which is the limitation of this study. First, the research sample was only the auditors of the Financial Supervisory Board of East Java Province, so the generalization of the results of this study is still quite weak. Therefore, further research needs to expand the scope of the research sample in order to get better and wider research results. Second, this study develops a questionnaire model with questions and statements, so that there is a possibility of bias when respondents answer the questionnaire. Therefore, further research is expected to be able to develop a questionnaire using case examples. Finally, further research is expected to develop this research by looking for other factors to detect fraud such as workload, auditor independence, time budget pressure and audit risk.

DETERMINANTS OF AUDITORS ABILITY IN FRAUD DETECTION
Cogent Business & Management

Dear Wahidahwati wahidahwati,

I am pleased to tell you that your work was accepted for publication in Cogent Business & Management on Sep 26, 2022.

Please note: only minor, or typographical changes can be introduced during typesetting and proofing of your manuscript. Major changes to your manuscript will not be permitted.

For your information, comments from the Editor and Reviewers can be found below if available, and you will have an opportunity to make minor changes at proof stage.

Your article will be published under the Creative Commons Attribution license (CC-BY 4.0), ensuring that your work will be freely accessible by all. Your article will also be shareable and adaptable by anyone as long as the user gives appropriate credit, provides a link to the license, and indicates if changes were made.

Once the version of record (VoR) of your article has been published in Cogent Business & Management, please feel free to deposit a copy in your institutional repository.

Thank you for submitting your work to this journal, and we hope that you will consider us for your future submissions.

Best wishes

Collins G. Ntim, PhD
Senior Editor
Cogent Business & Management

4. Bukti Koreksi Terakhir (ID Manuskrip: OABM A 2130165), tanggal 29 September 2022

Email dari OABM untuk melakukan review menggunakan *the Taylor Francis proofing system*

Bukti telah dilakukan review (koreksi) di *the taylor Francis proofing system* :

The screenshot displays the iAuthor interface for a manuscript. The header includes the iAuthor logo, Taylor & Francis logo, the manuscript ID 'OABM_A_2130165', a Help icon, and the author's name 'Wahidahwati wahidahwati'. The main content area shows the article title 'Determinants of Auditors Ability in Fraud Detection' by Wahidahwati Wahidahwati and Nur Fadjrih Asyik. It includes their affiliations, a short biography, and contact information. A 'Comments' sidebar on the right lists 68 comments, with visible ones (AQ1, AQ2, AQ3, AQ4) providing feedback on ORCID information, missing department details, and postal addresses.

This screenshot shows the 'Abstract' and 'Keywords' sections of the manuscript. The abstract text describes the study's aim to examine the effect of auditor experience, ethics, and personality on fraud detection, mentioning the use of a quantitative approach and multiple linear regression. The keywords section lists terms like 'Auditor's ability', 'auditors experience', 'auditor ethics', 'professional skepticism', 'auditor personality type', and 'fraud detection'. The 'Comments' sidebar on the right shows additional feedback (AQ4, AQ5, AQ6, AQ7, AQ8) regarding missing affiliation details, citation formatting (APA-7), and figure references.

PUBLIC INTEREST STATEMENT

The findings of this study have implications for Attribution Theory and Personality Type Theory, attribution theory explains how a person interprets an event caused by a person's behavior. While the theory of personality types explains that personality is all real thoughts, feelings and behaviors both consciously and unconsciously. The findings of this study have implications for the policy that auditor experience, auditor ethics, professional skepticism, and auditor personality type are against fraud detection, so that the research findings are used by the government and companies as assessment policies.

1. Introduction

It is important to do this because this study tries to compare the results of developed countries with developing countries, especially Indonesia, because in Indonesia there are still auditors who commit fraud with personal interests that have an impact on the workplace. Financial statements are documents that reflect the financial performance of a company during a certain period. Government financial statements and financial statements made by companies must be based on applicable financial standards and avoid material misstatements. Material misstatements that occur in the financial statements, according to the Statement of Auditing Standards No. 70, can be caused by errors or fraud. Fraud is an error that is done intentionally with the aim of making a profit by ignoring the losses that will be received by the other party. Meanwhile, an error is an error that is done unintentionally and does not aim to gain personal gain (Zimbelman et al., 2017). Furthermore, Zimbelman et al. (2017) stated that the intentional errors/ fraud that were not disclosed could have a detrimental effect on the financial reporting process itself. Therefore, the company's/government's financial statements need to be examined by an independent party from outside the company, commonly called an auditor, which aims to provide reasonable assurance that the government's/company's financial statements have been protected from material misstatement, either intentional misstatement/ fraud or unintentional misstatements (Sudarwanto et al. 2022).

Tjaraka et al., 2022; Utari, Iswoyo et al., 2021). Therefore, the task of an auditor is to provide assurance to interested parties that the financial statements have been prepared according to applicable standards and reflect the actual situation of a business entity.

The phenomenon that occurred in the report on the results of the examination of the regional government financial reports of East Java Province for the 2020 fiscal year, which obtained the results: Unqualified Opinion. In the report, there are many findings/ notes that need to be considered by the East Java Provincial government. The findings/records of Audit Board still finds weaknesses in internal control and problems related to non-compliance with laws and regulations, which do not materially affect the fairness of the presentation of Financial Statements for fiscal year 2020. Furthermore, other Audit Board findings/notes: (1) accountability for grant expenditures is incomplete. Such as spending on grants for street lighting assistance to community groups which are indicated to be carried out not according to the Regional Grant Agreement, namely overpayments for non-conformances in specifications and price overruns, (2) control over the implementation of Grant Expenditures in the form of unaccountable money and shortages volume of work at the Public Works Department of Highways. If Audit Board's findings are not immediately followed up, it could indicate fraud.

Attribution theory was first developed by Fritz Heider 1958 in (Weiner, 2008). This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade (Rachmawati, 2019). Yusuf and Nurhisan, (2008: AQG-74) states that The personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a

behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, (2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Fraud can be carried out in various ways, starting from the findings of Audit Board in examining government financial statements which are seen from four things, namely: (1) the fairness of the presentation of financial statement items in accordance with Government Accounting Standards, (2) adequacy of disclosure, (3) compliance with the provisions of laws and regulations, (4) effectiveness of the internal control system. Therefore, the auditor's ability to detect findings/frauds must continue to be improved. This is because each auditor as an individual has different limitations, so the level of ability to detect findings/frauds must also be different. The limitations of the auditor can lead to a gap or expectation gap between users of auditor services (Anggrawan, 2014); Aliyyah, Prasetya et al. (2021)AQ7; Prasetyo et al., 2021). Elfia and NR (2022) shows that auditor training has a positive effect on the auditor's ability to detect fraud, while time pressure and professional skepticism have no effect on the auditor's ability to detect fraud. Therefore, auditors are advised to attend training more often so that their ability to detect fraud will also improve. Several research results state that several factors can affect the auditor's ability to detect fraud. These factors include: (1) auditor experience, (2) implementation of ethical rules, (3) skepticism. Nurwahyuni and Isnaiwati (2021); Endarto et al. (2021); M. M. Indrawati et al., 2021) shows that the work experience of auditors has a significant effect on the ability to detect financial statement fraud, the professional

skepticism of auditors has a significant effect on the ability to detect financial statement fraud, and professional ethics has a significant effect on the ability to detect financial statement fraud. Based on the description above, this study aims to test and analyze the determinants of the Auditor's Ability to Detect Fraud in Financial Statements.

2. Literature review and hypothesis development

2.1. Attribution theory

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021; Rachmawati, 2019; Utari, Iswoyo et al., 2021). Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Abadi et al., 2021; Endarto, Taufiqurrahman, Indriastuty et al., 2021; Robbins & Judge, 2013). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization.

2.2. Personality type theory

Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors

2.4. Hypothesis development

2.4.1. The effect of auditor experience on fraud detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Kalbuana, Prasetyo et al., 2021; Rechmewati, 2019; Rusdiyanto et al., 2021). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Faradina (2016, 2021, 2021) states that audit experience is an experience gained from the length or number of tasks that have been handled by the auditor. Auditors who have a lot of experience will have the ability to find fraud that occurs in the company and can provide a better explanation than auditors who have no or little experience. In addition, the more auditors perform audits of financial statements, the higher the level of professional skepticism owned by the auditors. Without skepticism, even experienced auditors may not necessarily be able to find fraud in the company. The results of research conducted Kartikarini and Sugiarto (2016); Febriansyah and Novitasari (2021); Lismawati, Sari and Ismalia (2021); Helmiati and Helmiati (2021AQ9) that auditors

H1: Auditor experience has a positive effect on detection Fraud

2.4.2. The effects of auditor ethics on fraud detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021; Prasetyo, Endarti et al., 2021; Robbins & Judge, 2013). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in (Sample & Sample, 2017; (Prasetyo, Endarti et al., 2021b)AQ10; Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Ethics is basically related to morals that become the guide for a person or a group of nature to regulate their behavior, as well as benchmarks in assessing the goodness or badness of an action. An auditor must comply with ethical rules in carrying out his duties to facilitate the auditor in detecting fraud (Gusti & Ali, 2008; Prabowo et al., 2020; Susanto et al., 2021). The results of the study (Hassan, 2019; Helmiati & Helmiati, 2021; Pipaldi et al., 2018), show that auditor ethics has a positive effect on fraud detection. This shows that if an auditor follows the regulated professional ethics, it will guarantee the quality and increase the ability to detect fraud owned by the auditor. Khadilah et al. (2015, Rusdiyanto, Agustia et al., 2020, Rusdiyanto, Hidayat et al., 2020) stated that

the application of ethical rules owned by an auditor has an effect on quality audit results. The quality of the financial statements audited by an auditor is influenced by the ethical application of an auditor. Detection of fraud in the audit of the company's financial statements requires the auditor to have ethics, because ethical auditors have integrity and objectivity in carrying out their work. Nurwahyuni & Isnawati, 2021)AQ11; Yuhertiana, Arief et al., 2020, Yuhertiana et al., 2022) states that the application of ethical rules is defined as principles, rules, and moral values that are applied to regulate the behavior of an auditor in carrying out his duties. The SPKN lists three values that must be upheld by Audit Board of the Republic of Indonesia members, namely independence, integrity, and professionalism. Khadilah et al. (2015, 2020, 2020) stated that the ethics of the auditor when auditing reports can affect audit results to be of higher quality. The quality of the audited financial statements can be influenced by the ethics of the auditor.

With the application of ethical rules, it is hoped that the auditor can uphold a professional attitude in carrying out his duties and comply with the applicable professional code of ethics so that the possibility of fraud by the auditor does not occur. Based on the description above, the following hypothesis is formulated:

H2: The application of ethical rules has a positive effect on detection Fraud

2.4.3. The effect of professional skepticism on fraud detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016; Juanamasta et al., 2019). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in

attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Rachmawati, 2019; Yuhertiana, Bastian et al., 2019; Yuhertiana, Patrioty et al., 2019). Yusuf and Nurihsan, (2008:74; Rahma et al., 2016; Tatiana & Yuhertiana, 2014) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Trinanda and Waluyo (2016; Yuhertiana, 2011b, 2011a) states that the higher the professional skepticism of an auditor, the less likely it is that fraud will occur. Professional skills require auditors to exercise professional skepticism, namely an attitude that includes a questioning mind and an objective evaluation of the adequacy, competence, and relevance of evidence (Audit Board of the Republic of Indonesia Regulation No. 1 of 2007). Professional Standards for Certified Public Accountants explain that professional skepticism is an attitude that always questions and evaluates audit evidence critically. Umri and Islahuddin (2022, 2022, 2015) states that the high attitude of skepticism owned by the auditor results in greater fraud that will be detected. Kartikanini and Sugiarto (2016, 2021, 2016) shows the same result, namely that the attitude of professional skepticism has a positive influence on the ability of an auditor to detect fraud. The higher the attitude of professional skepticism that the auditor has, the more willingness or desire to find out the signs of fraud around him.

Fullerton and Durtschi (2011, 2019, 2020) found that auditors with high skepticism will increase their ability to detect it by developing additional information searches when faced with symptoms of fraud. This finding is supported by research conducted by Faradina (2016, 2016). An auditor is required to have an attitude of professional skepticism in carrying out his audit duties, especially for

the possibility of fraud even though the fraud will not necessarily occur. Auditors who have a skeptical attitude will not immediately believe the assertions given by management. Auditors will always look for additional information and evidence that can be used to support management's assertions. Auditors who have an attitude of professional skepticism in making decisions and providing opinions will be more careful, the auditor will also seek additional information and evidence to ensure that the audited financial statements are free from all forms of misstatement. The results of research conducted by (Helmiati & Helmiati, 2021; Lismawati, Sari & Ismalia, 2021; Nurwahyuni & Isnawati, 2021) also found evidence that professional skepticism has a positive effect on an auditor's ability to detect fraud, because the higher the skepticism of an auditor, the higher the level of auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H3: Professional Skepticism has a Positive Effect on Fraud Detection

2.4.4. The effect of personality type auditors on fraud detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Asyik et al., 2022; Robbins & Judge, 2013; Wahidahwati & Ardini, 2021). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in (Adi et al., 2022; Sample & Sample, 2017; Sudaryanto et al., 2022), namely: 1. The way a person focuses their attention and

gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Personality types are included in internal forces, namely factors that come from within a person or individual whose abilities can personally influence their performance and behavior, so that the auditor's personality type can influence the auditor's behavior in acting. Determination of personality type in this study using the Myers Briggs Type Indicator which introduces 16 types of a person's personality which is a combination of four pairs of human preferences. Robbins and Judge (2013), Sudaryanto et al., 2021, Utari, Sudaryanto et al., 2021) suggest that a person's personality type can influence the decision making. (Kusumawaty & Betri, 2019; Kartikarini & Sugiarto, 2016; Rudy et al. 2017 AQ12) shows personality types positively influence to financial report fraud.

Noviyanti (2008, 2017) found that auditors with Sense and Thinking and Intuition and Thinking personality types are auditors who have higher professional skepticism than auditors with other personality types. Personality with a combination type of Sense and Thinking and Intuition and Thinking is a type that tends to be logical in making decisions because it considers the facts. The combination type of NT tends to emphasize patterns, contexts, and relationships with dubious and inconclusive data where in these conditions the auditor is required to guess the meaning of the data intuitively, and then use it as a basis for digging up facts with logic and objective analysis and critical in situations where decisions must be made (Tuanakotta, 2013; Hanim et al., 2019; Sudaryanto et al., 2020). In the context of auditing, fraud is generally systematic or has a pattern, sometimes it is not convincing, so that to explore it, an objective and critical logic of analysis is needed. Based on this concept, it is suspected that there is an influence of the NT combination personality type that exists in the auditor on the auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H4: Personality Type Auditors has a Positive Effect on Fraud Detection

3. Research method

3.1. Research sample

The research population is 156 Audit Board of the Republic of Indonesia auditors spread across various regional entities in East Java Province which has 38 district/city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach, namely a sampling technique that does not provide equal opportunities for each part of the population to be used as research samples (Sugiyono, 2014 AQ13; Putri & Sudaryanto, 2018; Sudaryanto et al., 2019). In addition, the sample uses the Convenience Sampling technique, which is choosing a sample from population elements (people or events) whose data is easy to obtain. This sampling method was chosen based on the difficulty of the auditor's willingness to be used as a research sample. analysis technique using multiple linear regression with SPSS software which is used to analyze the data in this study. One of the regression solving procedures, SPSS has a high degree of flexibility in research that relates theories, concepts, and data that can be done to the variables in the study.

3.2. Variable operational definition

3.2.1. Auditor experience

Experience is a real activity that has been carried out by the auditor where audit experience is seen from the length of time the auditor has worked. Auditor experience in work can expand work ability. The more often a person does the same job, the more skilled and faster he gets the job done. The more kinds of work a person does, the more complex and extensive his work experience will be, and it allows for increased performance (Simanjuntak et al. (2015). In this study, the indicators used to measure the work experience variable from the research of Sukriyah and Inapty

(2009), namely length of work, number of examination tasks, and adjusted for the addition of indicators from Agustin (2013), namely work ability, and task intensity and career development. Responses from respondents are determined on a scale of 1 to 5.

3.2.2. Auditor ethics

The application of ethical rules for auditors consists of principles, rules, and moral values, which are applied and must be adhered to in regulating the behavior of an auditor in carrying out their duties. The profession as an auditor is required to uphold professional ethics because auditors have responsibilities to various parties, including responsibility for the auditee, responsibility for the government, and responsibility for the community (Nurwiyati, 2015). **AQ14** By applying these ethical rules, it is hoped that an auditor will be able to uphold a professional attitude and comply with the applicable professional code of ethics so that the possibility of fraud that may be carried out by the auditor will not occur. The study used three indicators of Audit Board of the Republic of Indonesia code of ethics which included integrity, professionalism **and was also adjusted by adding indicators from Sukriyah and Inapty (2009) namely independence.** Responses from respondents were determined using a Likert scale of 1 to 5.

3.2.3. Professional skepticism

Professional Skepticism is an attitude that should be owned by an auditor which balances suspicion and trust. In ISA No. 200, it is said that the attitude of professional skepticism is that the auditor makes a critical assessment, with a questioning mind on the validity of the evidence obtained, is wary of the audit evidence that the auditor has obtained, is alert to audit evidence that is contradictory or contradictory. raises questions regarding reliability and documents, and also responds with questions and other information obtained from management and related parties (IFAC, 2004). Professional skepticism is measured using indicators that have been developed by Agustin (2013), namely critical thinking, professionalism, assumptions, accuracy, accuracy in examining the client's financial statements, understanding of audit evidence, and also adjusted for

the addition of indicator, namely attitude. Responses from respondents are determined by a Likert scale of 1 to 5.

3.2.4. Personality type

Personality is defined by Gordon Allport in (Noviyanti, 2008) as an organic organization within the individual who has a psychological system that determines his unique adjustment to his environment. Thus, personality type is a person's adjustment to the environment according to his way. In other words, personality is the unique ways that individuals react to and interact with others. In this study, a person's personality type was measured using the Myers Briggs Type Indicator. The indicator for the personality type variable consists of 40 question items developed by Nasution and Fitriany (2012); Mudrika (2011). Of the 40 statement items contained in the questionnaire, 5 statement items describe each preference. The auditor is asked to choose one of the two contradictory statements between 4 pairs of preferences that correspond to the auditor's personality type. Auditors with Sensing-Thinking and Intuition-Thinking personality types were given a score of 1, and auditors with other personality types were given a score of 0.

3.2.5. Fraud detection

Fraud detection is a process to be able to find or disclose deviant actions that are carried out intentionally and result in misstatement of a financial statement. Fraud detection includes the identification of fraud indicators that require follow-up by the auditor to conduct an investigation. Fraud detection in this study was measured using indicators from Koroy (2008) developed by Simanjuntak et al. (2015) where the indicators of fraud detection are understanding the internal control system, characteristics of fraud, audit environment, audit methods, forms of fraud, and testing documentation, and personal. Responses from respondents are determined by a Likert scale of 1 to 5.

3.3. Data analysis technique

3.3.1. Validity test and reliability test

The data obtained from the questionnaire was tested to ensure the research data was valid and reliable.

3.3.2. Classic assumption test

The classical assumption tests carried out in this study were the normality test, the multicollinearity test, and the heteroscedasticity test.

3.3.3. Hypothesis test

Multiple linear regression analysis is used to determine the effect of more than one independent variable with the dependent variable (Sugiyono, 2014). This study examines the effect of auditor experience, auditor ethics, professional skepticism and auditor personality type affect the auditor's ability to detect fraud. The formula used is as follows:

$$PK = a + b1PA + b2PAE + b3SP + b4TK + e$$

4. Result and discussion

4.1. Descriptive statistics

Variable descriptive statistical tests to provide an overview of the average (mean), standard deviation, minimum value, maximum value, and number of studies are presented in the table 1 as follows:

Table 1. AQ15 Descriptive statistic

Variable	N	Minimum	Maximum	Mean	Std Dev
Auditors experience	57	32	54	45,16	4,71

4.2. Data validity test

The validity of the data was tested using the Pearson Correlation test. The following is a validity test:

Table 2. AQ16 Validity test results

Number of question	Pearson Corelation (r hitung)				r tabel
	Auditors experience	Auditor ethics	Profressional skeptism	Auditor personal type	
1	0,81	0,60	0,82	0,81	0,260
2	0,61	0,75	0,90	0,69	
3	0, 87	0,77	0,86	0,76	
4	0,67	0,79	0,82	0,77	
5	0,74	0,78	0,84	0,80	
6	0,73	0,90	089	0,82	
7	0,66	0,90	0,80	0,77	
8	0,84	0,87	0,76	0,89	
9	0,82	0,83	0,68	0,84	
10	0,79	0,71	0,79	0,66	
11	0,62	-	-	0,84	
12	-	-	-	0,75	

Table 2 shows the results of the validity test it is known that all values of r arithmetic > r table (r table is obtained from the formula $n-2 = 57-2 = 55$ and $df (n-2) = 0.05$) then the value of r count (55;0.05) is 0.260. The table above shows that from all questions on each variable the value of r is

calculated > 0.260. So it is declared valid.

4.3. Reliability test

For reliability testing is carried out to determine whether the results of this questionnaire can be trusted or reliable. The following is a reliability test:

Table 3.AQ17 Reliability test result

Variable	Cronbrach's Alpha
Auditors experience	0,840
Auditor ethics	0,927
Professional sceptism	0,943
Auditor personality type	0,942

From Table 3 shows the results of the reliability test, it is known that the Cronbrach's Alpha value of auditor experience is 0.840, the Cronbrach's Alpha value of the application of ethical rules is 0.927, the Cronbrach's Alpha value of professional skepticism is 0.943, the Cronbrach's Alpha value of fraud detection is 0.942. So it can be concluded that for all variables in this study have a value greater than 0.60 then it can be declared reliable.

4.4. Classic assumption test

4.4.1. Normality test

This normality test uses the Kolmogroff-Smirnof test, from this test it can be seen that the residual distribution is normal or not. The following is a normality test:

Table 4.AQ18 Normality test result

		Unstandardized Residual
N		57
Normal Parameters ^{ab}	Mean	,00000
	Std. Deviation	2,154,398
Most Extreme Differences	Absolute	0,11
	Positive	0,09
	Negative	-0,11
Kolmogorov-Smirnov Z		0,85
Asymp. Sig. (2-tailed)		0,46

Table 4 shows the normality test result. Based on the Kolmogroff-Smirnov test, it has a significance value > 0.05 (5%), the conclusion is that all data are normal.

4.4.2. Multicollinearity test

Multicollinearity testing is done by looking at the VIF and Tolerance numbers. The following is a multicollinearity test:

Table 5.AQ19 Multicollinearity test result

Variable	Collinearity Statistics	
	Tolerance	VIF
Auditors experience	0,49	2,05
Auditor ethics	0,26	3,91
Professional sceptism	0,24	4,10

Auditor personality type	0,92	1,08
--------------------------	------	------

Table 5 shows the multicollinearity test. The results of the multicollinearity test show that the value for tolerance is > 0.1 and $VIF < 10$. So it can be said that the data in this study is free from multicollinearity. This means that there is no correlation between the independent variables in this study.

4.4.3. Heteroscedasticity test

The heteroscedasticity test assesses whether there is an inequality of variance for all residual observations from one observation to another.

Based on the glejser test, it can be seen in table 6 that the four variables, namely auditor experience, application of ethical rules, professional skepticism, and personality type have a Sig value > 0.05 , so it can be concluded that there is no heteroscedasticity.

Table 6. AQ20 Heterokedastisity test result

Variable	t	Sig.	Decision
Auditors experience	-1,71	0,10	No heteroscedasticity
Auditor ethics	-0,35	0,73	No heteroscedasticity
Professional sceptism	0,41	0,68	No heteroscedasticity
Auditor personality type	0,45	0,65	No heteroscedasticity

4.4.4. Multiple linear regression analysis

The results of the multiple linear regression test that can be seen in table 7 are used as a basis for determining the behavior of the regression model using the F test, determining the coefficient of

R Square /Adjusted Square	0,82/0,81			
Uji F	60,65			
Sig. Uji F	0,000			

4.4.5. Goodness of fit

Goodness of fit is used to determine whether this research model is fit. In other words, Goodness of fit states the level of suitability (fit) of the research model with the ideal model for that research. Based on the table above, it shows that the test value of $F = 60.651$, with a significance level of 0.000 less than 0.05 , the regression model is said to be appropriate. This shows that the regression model of this study is in accordance with the ideal model.

4.4.6. Coefficient of determination test results (R^2)

The coefficient of determination test is used to measure how far the model's ability to explain the variation of the dependent variable is. The table above shows that the Adjusted R coefficient value

variation of the dependent variable is. The table above shows that the Adjusted R coefficient value is 0.810, which means that 81.0% of the fraud detection variables are influenced by the auditor's experience, application of ethical rules, personality type, and professional skepticism while the remaining 19.0% is influenced by other factors that are not included in this research model.

4.5. Discussion of research results

4.5.1. Findings the effect of auditor experience on fraud detection

The findings of Hypothesis 1 prove that the auditor's experience has a positive effect on fraud detection. The table above shows that the significance value is $0.00 < 0.05$ (5%), so the hypothesis (H1) is accepted, supported by the hypothesis proposed Auditor experience has a positive effect on fraud detection. The direction of the coefficient which is positive indicates that the more experienced an auditor is, the better the auditor's ability to detect fraud that occurs. The results of this study support the research of (Kartikarini & Sugiarto, 2016); Febriansyah and Novitasari (2021); Lismawati, Sari and Ismalia (2021); Helmiati and Helmiati (2021); Faradina (2016); Arnanda et al. (2022) which also found evidence that auditor experience has a positive effect on fraud detection.

Experienced auditors will show a higher level of selective attention to relevant audit information and evidence (Hobson et al., 2015; Jaffar et al., 2011; Pratiwi et al., 2019; Suryandari & Yuesti, 2017). The experience referred to is the experience of the auditor in conducting audits of financial statements and audit assignments in the field, both in terms of the length of time, as well as the number of audit assignments that have been carried out. (Suraida, 2005) states that in conducting an audit of financial statements, both in terms of the length of time and the number of assignments that have been handled, that the more audit experience an auditor has, the more able to produce various kinds of audits. This research is supported by research by Arsendy et al. (2017); Adyani (2014) finding evidence that auditor experience has a positive effect on auditors' ability to detect fraud. Experienced auditors are not enough to be able to detect fraud, auditors, an auditor must

also comply with the implementation of ethical rules. Several previous studies in various countries have also stated that auditor experience has a positive influence on fraud detection and audit quality (Al-Ebel et al., 2020; Azza & Gaballa, 2011; Kuntari et al., 2017). In Yemen, audit quality and fraud prevention cannot be separated from the spiritual perception of each auditor. In several other studies, the educational experience of auditors has no effect on audit quality in both Libya and Turkey (Daoust & Malsch, 2019; Ocak & Ntim, 2018). AQ22 However, the experience gained from abroad provides added value for the auditor (Hou et al., 2020).

These findings are supported by Attribution Theory and Personality Type Theory, Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade-in (Rechmawati, 2019). while the Personality Type Theory explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, 2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or

Perceiving)

4.5.2. Findings the effects of auditor ethics on fraud detection

The findings of Hypothesis 2 prove that auditor ethics has a positive effect on fraud detection. The results from the table above show a significance value of $0.030 < 0.05$ (5%), so that the hypothesis (H2) is accepted, supported by the initial hypothesis proposed. The application of ethical rules has a positive effect on fraud detection. The more obedient auditors to ethical rules, especially those written (professional code of ethics), the easier it will be for auditors to detect fraud. The results of this study are in line with the results of research conducted by Pipaldi et al. (2018); Hassan (2019); Helmiati and Helmiati (2021) which also found evidence that the application of ethical rules has a positive effect on fraud detection.

Professional Ethics are norms that must be adhered to by every member of the State Audit Board as State Examiner while carrying out their duties to maintain their dignity, honor, image, and credibility. Trinanda and Waluyo (2016) found evidence that professional ethics affect the ability of auditors to detect fraud. The results of research analysis Helmiati and Helmiati (2021) shows that auditor ethics has a positive and significant effect on fraud detection. Other studies also mention that auditor ethics greatly affects audit quality, including finding fraud (Haeridistia & Agustin, 2019; Kuntari et al., 2017).

These findings are supported by Attribution Theory and Personality Type Theory, Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade-in (Rachmawati, 2019), while the Personality Type Theory

explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, (2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

4.5.3. Findings the effect of professional skepticism on fraud detection

The findings Hypothesis 3 proves that professional skepticism has a positive effect on fraud detection. Results The table above shows a significance value of $0.000 < 0.05$ (5%), the hypothesis (H3) is accepted, the findings are supported by the hypothesis proposed Professional Skepticism has a Positive Effect on Fraud Detection. The direction of the positive coefficient indicates that the more skeptical Auditor will be able to detect fraud at the audit planning stage, and will carry out the detection at the next audit stage. The results of this study are in line with the results of research conducted by Simanjuntak et al. (2015); Fullerton and Durtschi (2011); Biksa dan wiranata (2016); Faradina (2016), Rachmawati (2019), Nurwahyuni and Isniawati (2021), and Febriansyah and Novitasari (2021) which found evidence that professional skepticism has an effect on against fraud detection. An audit designed with high professional skepticism will be able to provide adequate assurance to detect fraudulent financial statements or errors in financial statements. In other words, the attitude of professional skepticism can assist the auditor in evaluating evidence by conducting audit tests to obtain assurance that there may be symptoms of fraud that will occur.

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti & Res, (Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al. (2018); L. Indrawati et al. (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

4.5.4. Findings the effect of personality type auditors on fraud detection

The findings of Hypothesis 4, the auditor's personality type has a positive effect on fraud detection. The table above shows a significance value of $0.021 < 0.05$ (5%), then the hypothesis (H4) is accepted. The findings are supported by the hypothesis proposed Personality Type Auditors has a Positive Effect on Fraud Detection. The direction of the positive coefficient indicates that the better the personality type of the auditor, the easier it is to detect fraud. In this study, personality types were determined using the MBTI with 4 pairs of preferences, namely: 1) Extravert (E) and Introverted (I); 2) Sensing (S) and Intuition (N); 3) Thinking (T) and Feeling (F); 4) Judging (J) and Perceiving (P). Auditors with a combination of ST and NT personality types are auditors who tend to think logically in making decisions and will consider all available facts to support their decisions. Individuals with the ST personality type process information and make decisions based on the facts obtained by using logical analysis. Meanwhile, NT processes information based on the possibilities that occur and considers them theoretically and scientifically in making decisions. The results of this study support research conducted by Kartikarini and Sugiarto (2016), Suryanto et al. (2017), Robbins and Judge (2013), and Kusumawaty and Betri (2019) which state that personality type has a positive

effect on fraud detection.

Personality type also one of the factor that influences an auditor in detecting financial statements (Indrasti et al., 2019; Umar et al., 2019). To detect fraud, an auditor also needs to have a personality type. Personality is a person's behavior when interacting with other people. Auditors who have a certain personality are easier to detect fraud. The personality types that are easier to detect fraud are auditors with ST and NT personalities compared to SF and NF personality types. This is because auditors who have a personality type with good senses can find fraud in the company. The ability of the auditor to detect fraud will have an impact on the provision of an opinion on the audit results. To improve its ability, the auditor must know and understand fraud, both of its kind, the characteristics of fraud and how to detect the fraud (Simanjuntak et al., 2015).

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti & Res; Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al. (2018); L. Indrawati et al. (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

5. Conclusion

Based on the results of the analysis and discussion, it can be concluded that the auditor's experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud, meaning that the higher and lower the auditor's experience, meaning that the higher and lower the auditor's ethics, professional skepticism, and the type of

meaning that the higher and lower the auditor's ethics, professional skepticism, and the type of auditor's ethics, personality has an impact on increasing and decreasing the ability of auditors to detect fraud. The findings are empirically supported by attribution theory and personality type theory, attribution theory explains that how a person interprets an event that causes a person's behavior is determined by internal forces while personality type theory explains that personality is all real thoughts, feelings, and behaviors that are both realized and realized, or unconsciously. The findings empirically have implications for government and company policies by looking at these findings which explain that auditor experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud. This study has limitations that cannot be avoided. Disclosure of limitations aims to make this research understandable with a non-misleading interpretation. In addition, the disclosure of limitations also has the aim that further research can fill the blank space which is the limitation of this study. First, the research sample was only the auditors of the Financial Supervisory Board of East Java Province, so the generalization of the results of this study is still quite weak. Therefore, further research needs to expand the scope of the research sample in order to get better and wider research results. Second, this study develops a questionnaire model with questions and statements, so that there is a possibility of bias when respondents answer the questionnaire. Therefore, further research is expected to be able to develop a questionnaire using case examples. Finally, further research is expected to develop this research by looking for other factors to detect fraud such as workload, auditor independence, time budget pressure and audit risk.

Email konfirmasi Koreksi telah dilakukan via Taylor and Francis

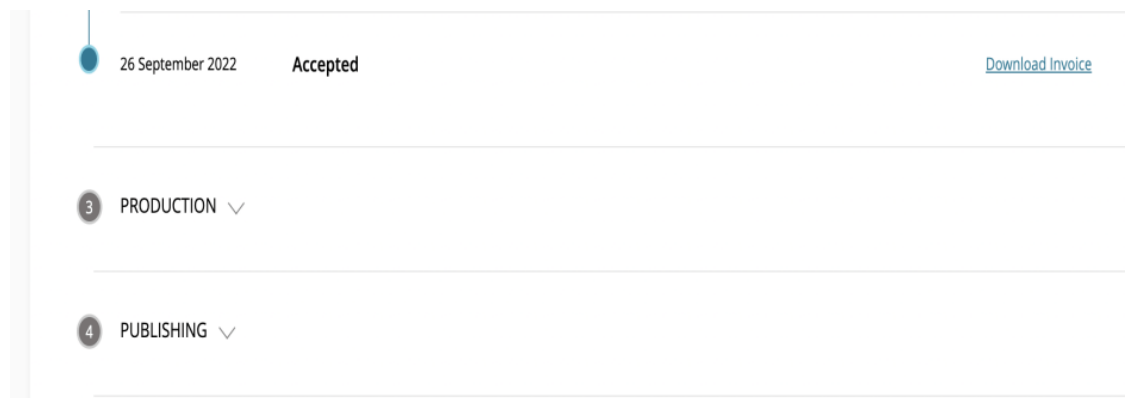

The screenshot shows a Gmail interface with a sidebar on the left containing navigation options like Mail, Chat, and Meet. The main content area displays an email from **iauthorsupport@integra.co.in** dated 3 Oct 2022, 15.12. The email subject is "Author corrections submitted for Manuscript ID: OABM A 2130165". The body of the email contains the following information:

- Manuscript Title: OABM - (DETERMINANTS OF AUDITORS ABILITY IN FRAUD DETECTION)
- Manuscript DOI: 10.1080/23311975.2022.2130165
- Journal: OABM-Cogent Business & Management
- Date proof corrections submitted: 3 October 2022

The email text reads: "Dear Wahidahwati wahidahwati, This email confirms that you have submitted corrections to your proofs via the Taylor & Francis online proofing system. Your record of corrections are now available using the Taylor & Francis online proofing system." It includes a link "Click here" and contact information for the Production Editor: Suriyanarayanan Murugaiyan, with email OABM-production@journals.tandf.co.uk. The email concludes with "Thank you. Yours sincerely, Taylor & Francis Online Proofing Team".

5. Bukti Artikel Di Produksi dan di Publishing Di System

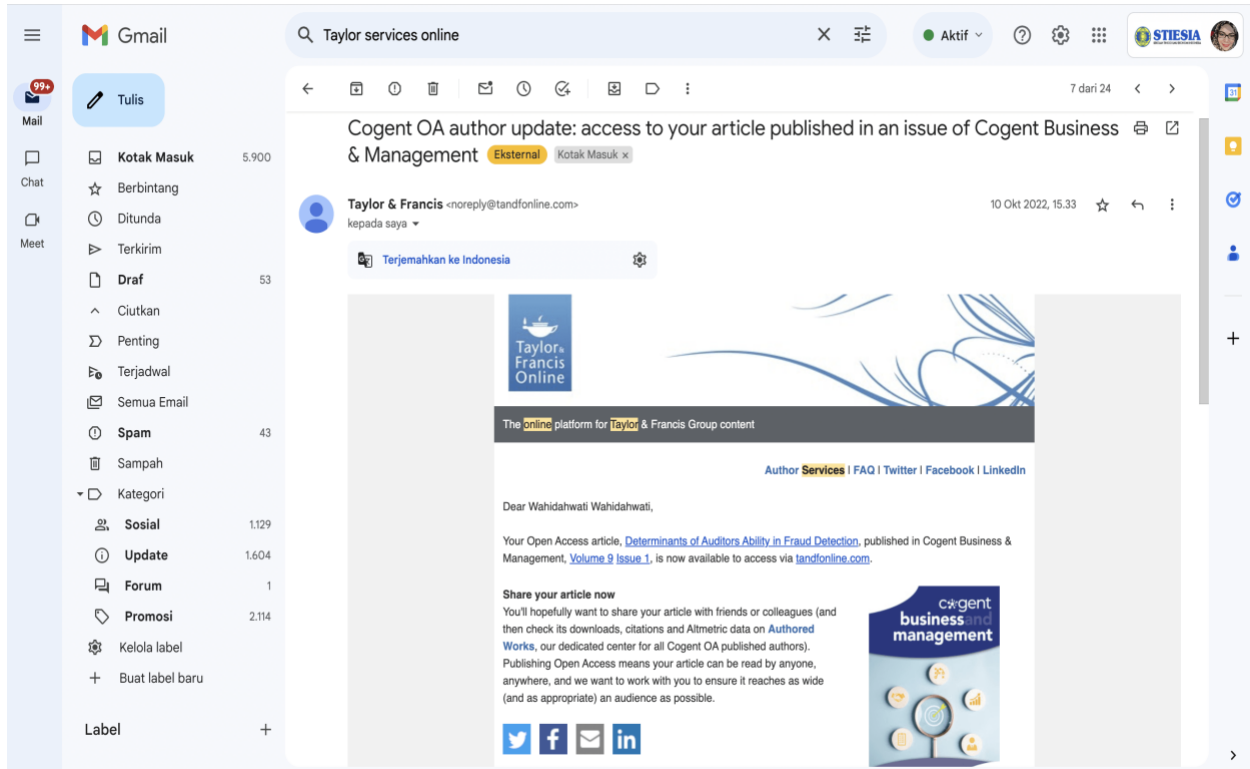

The screenshot shows a submission tracking interface with a vertical timeline on the left. The main content area displays the following information:

article's publication on social media is a highly effective way of highlighting your research. Find out more about how you can work with us to promote your work.

Not sure how to access your Authored Works?
If you haven't yet registered, you can do so using wahidahwati@stiesia.ac.id (this is the email you used whilst your manuscript was going through production).

Once you've completed the quick registration you'll be sent an email asking you to confirm. Click on the verification link and you can then login (using the above email address) whenever you want to by going to **Taylor & Francis Online**. Once you have logged in, click on "Your Account" at the top of the page to see the latest updates on your article.

If you have any problems accessing your **Taylor & Francis Online** account please contact us. Thank you for publishing Open Access with us.

Kind regards,

Stewart Gardiner
Global Production Director, Journals
Taylor & Francis Group

PROOF COVER SHEET

Journal acronym: OABM

Author(s): Wahidahwati Wahidahwati, Nur Fadjrih Asyik and Collins G. Ntim Reviewing editor:

Article title: Determinants of Auditors Ability in Fraud Detection

Article no: 10.1080/23311975.2022.2130165

Enclosures: 1) Query sheet
2) Article proofs

Dear Author,

Please find attached the proofs for your article.

1. Please check these proofs carefully to identify any errors that may have arisen during the writing or production process. Cogent OA requires that the corresponding author checks and approves these proofs in order to proceed with publication.

Please limit any changes to the correction of errors. We are not able to make stylistic changes, or add or delete material at this stage.

We generally expect there to be no more than 30 minor corrections during this proof stage. Your PDF proof file has been enabled so that you can comment on the proof directly using Adobe Acrobat. This is the easiest and clearest way for you to ensure that your corrections will be incorporated.

Queries are marked in the margins of the proofs, and you can also click the hyperlinks below. Content changes made during copy-editing are shown as tracked changes. Inserted text is in **red font** and revisions have a red indicator ▲. Changes can also be viewed using the list comments function. To correct the proofs, you should insert or delete text following the instructions after the author queries below, but **do not add comments to the existing tracked changes**.

2. Please review the table of contributors below and confirm that the first and last names are structured correctly and that the authors are listed in the correct order of contribution. This check is to ensure that your names will appear correctly online and when the article is indexed.

Sequence	Prefix	Given name(s)	Surname	Suffix
1		Wahidahwati	Wahidahwati	
2		Nur Fadjrih	Asyik	
3		Collins G.	Ntim	Reviewing editor:

AUTHOR QUERIES

General points:

1. **Permissions:** You have warranted that you have secured the necessary written permission from the appropriate copyright owner for the reproduction of any text, illustration, or other material in your article. For further guidance on this topic please see:
<http://journalauthors.tandf.co.uk/copyright/usingThirdPartyMaterial.asp>.
2. **Third-party material:** If there is material in your article that is owned by a third party, please check that the necessary details of the copyright/rights owner are shown correctly.
3. **Affiliation:** The corresponding author is responsible for ensuring that address and email details are correct for all the co-authors. Affiliations given in the article should be the affiliation at the time the research was conducted. For further guidance on this topic please see:
<http://journalauthors.tandf.co.uk/preparation/writing.asp>.
4. **Funding:** Please include details of any funders for your research at the end of the article under a heading of 'Funding'. If the research is supported by a funding agency please insert the phrase 'This work was supported by <insert the name of the funding agency in full >', followed by the grant number in square brackets '[grant number xxxx]'.
5. **Supplemental / supporting information and underlying research data:** Where applicable, we encourage you to provide a link to the data underlying your research (e.g. samples, models, survey data). If you are able to do so, please insert this sentence before the reference section: 'The underlying research data for this article can be accessed at <full link>/ description of location [author to complete]'. Data can be deposited, stored and linked to freely on services such as Figshare (www.figshare.com). We also encourage the inclusion of supplemental information that supports and enriches your article (eg, short video or audio files, additional figures and tables). Where this has been provided, it will appear alongside the published article online and a link will be included by Cogent OA on the PDF of your article. For further information on this topic please see:
<http://journalauthors.tandf.co.uk/preparation/supplementalMaterial.asp>.
6. The **CrossRef database** (www.crossref.org/) has been used to validate the references. Mismatches will have resulted in a query below.

- AQ1** Please note that the ORCID for Wahidahwati Wahidahwati has been created from information provided through CATS. Please correct if this is inaccurate.
- AQ2** Please provide missing Department for the affiliation.
- AQ3** Please provide complete postal address for the corresponding author.
- AQ4** Please provide missing Department for the affiliation.
- AQ5** The reference "Zimbelman et al., 2017" is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [APA-7]
- AQ6** The reference "Yusuf and Nurihsan, (2008" is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [APA-7]
- AQ7** Please clarify whether Aliyyah et al., 2021 should be Aliyyah, Siswomihardjo, et al., 2021, or Aliyyah, Prasetyo, et al., 2021.
- AQ8** Please mention Figure 1 in the text.
- AQ9** The spelling of "Helmiati and Helmiati, 2021" has been changed to match the entry in the references list. Please provide revisions if this is incorrect.
- AQ10** Please clarify whether Prasetyo et al., 2021 should be Prasetyo, Aliyyah, et al., 2021, or Prasetyo, Endarti, et al., 2021.

- AQ11** The year for “Nurwahyuni and Isnawati, 2015” has been changed to 2021 to match the entry in the references list. Please provide revisions if this is incorrect.
- AQ12** The reference “Rudy et al 2017” is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [APA-7]
- AQ13** The reference “Sugiyono, 2014” is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [APA-7]
- AQ14** The reference “Nurwiyati, 2015” is cited in the text but is not listed in the references list. Please either delete in-text citation or provide full reference details following journal style [APA-7]
- AQ15** Please mention Table 1 in the text.
- AQ16** Please mention Table 2 in the text.
- AQ17** Please mention Table 3 in the text.
- AQ18** Please mention Table 4 in the text.
- AQ19** Please mention Table 5 in the text.
- AQ20** Please mention Table 6 in the text.
- AQ21** Please mention Table 7 in the text.
- AQ22** The spelling of “Ocak and Ntim, 2018” has been changed to match the entry in the references list. Please provide revisions if this is incorrect.
- AQ23** Please provide missing DOI or URL, if available, for the “Abadi et al., 2021” references list entry.
- AQ24** Please provide missing Publisher name/editor name or institutional editor name for the “Agustin, 2013” references list entry.
- AQ25** Please provide missing publisher name for the “Al-Ebel et al., 2020” references list entry.
- AQ26** Please provide missing Issue for the “Aliyyah et al., 2021” references list entry.
- AQ27** The Reference “Aliyyah et al., 2021” is listed in the references list but is not cited in the text. Please either cite the reference or remove it from the references list.
- AQ28** Please provide missing DOI or URL, if available, for the “Anggriawan, 2014” references list entry.

- AQ68** The Reference “Yuhertiana et al., 2020” is listed in the references list but is not cited in the text. Please either cite the reference or remove it from the references list.

How to make corrections to your proofs using Adobe Acrobat/Reader

Taylor & Francis offers you a choice of options to help you make corrections to your proofs. Your PDF proof file has been enabled so that you can mark up the proof directly using Adobe Acrobat/Reader. This is the simplest and best way for you to ensure that your corrections will be incorporated. If you wish to do this, please follow these instructions:

1. Save the file to your hard disk.
2. Check which version of Adobe Acrobat/Reader you have on your computer. You can do this by clicking on the “Help” tab, and then “About”.

If Adobe Reader is not installed, you can get the latest version free from <http://get.adobe.com/reader/>.

3. If you have Adobe Acrobat/Reader 10 or a later version, click on the “Comment” link at the right-hand side to view the Comments pane.

4. You can then select any text and mark it up for deletion or replacement, or insert new text as needed. Please note that these will clearly be displayed in the Comments pane and secondary annotation is not needed to draw attention to your corrections. If you need to include new sections of text, it is also possible to add a comment to the proofs. To do this, use the Sticky Note tool in the task bar. Please also see our FAQs here: <http://journalauthors.tandf.co.uk/production/index.asp>.

5. Make sure that you save the file when you close the document before uploading it to CATS using the “Upload File” button on the online correction form. If you have more than one file, please zip them together and then upload the zip file.

If you prefer, you can make your corrections using the CATS online correction form.

Troubleshooting

Acrobat help: <http://helpx.adobe.com/acrobat.html>

Reader help: <http://helpx.adobe.com/reader.html>

Please note that full user guides for earlier versions of these programs are available from the Adobe Help pages by clicking on the link “Previous versions” under the “Help and tutorials” heading from the relevant link above. Commenting functionality is available from Adobe Reader 8.0 onwards and from Adobe Acrobat 7.0 onwards.

Firefox users: Firefox’s inbuilt PDF Viewer is set to the default; please see the following for instructions on how to use this and download the PDF to your hard drive:

http://support.mozilla.org/en-US/kb/view-pdf-files-firefox-without-downloading-them#w_using-a-pdf-reader-plugin

Determinants of Auditors Ability in Fraud Detection

Wahidahwati Wahidahwati^{1*} and Nur Fadjrih Asyik¹

Abstract: This study aims to examine the effect of auditor experience, auditor ethics, professional skepticism, and auditor personality type on fraud detection. This research was designed using a quantitative approach. Data analysis using multiple linear regression model with spss software. There are several tests carried out before carrying out data analysis. The analysis prerequisite tests include data validity, reliability, normality, multicollinearity, and heteroscedasticity tests. The population and sample in this study were 156 supreme audit boards spread across various regional entities in east java province consisting of 38 city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach. The sample in this study amounted to fifty-seven auditors. The results show that auditor experience has a positive and significant effect on fraud detection, auditor ethics has a positive and significant effect on fraud detection, professional skepticism has a positive and significant effect on fraud detection and auditor personality type has a positive and significant effect on fraud detection. The findings of this study are supported by attribution theory and personality type theory.

Subjects: Accounting; Public & Nonprofit Management; Human Resource Management

Keywords: Auditor's ability; auditors experience; auditor ethics; professional skepticism; auditor personality type; fraud detection

He obtained his Bachelor's degree in Accounting from Indonesia School of Economics (STIESIA) Surabaya Indonesia with a degree (S.E), Master of Accounting Postgraduate Program from Gadjah Mada University with a degree (M.Si), a Doctoral Degree in Accounting from Gadjah Mada University with a degree (Dr.)

PUBLIC INTEREST STATEMENT

The findings of this study have implications for Attribution Theory and Personality Type Theory, attribution theory explains how a person interprets an event caused by a person's behavior. While the theory of personality types explains that personality is all real thoughts, feelings and behaviors both consciously and unconsciously. The findings of this study have implications for the policy that auditor experience, auditor ethics, professional skepticism, and auditor personality type are against fraud detection, so that the research findings are used by the government and companies as assessment policies.

1. Introduction

It is important to do this because this study tries to compare the results of developed countries with developing countries, especially Indonesia, because in Indonesia there are still auditors who commit fraud with personal interests that have an impact on the workplace. Financial statements are documents that reflect the financial performance of a company during a certain period. Government financial statements and financial statements made by companies must be based on applicable financial standards and avoid material misstatements. Material misstatements that occur in the financial statements, according to the Statement of Auditing Standards No. 70, can be caused by errors or fraud. Fraud is an error that is done intentionally with the aim of making a profit by ignoring the losses that will be received by the other party. Meanwhile, an error is an error that is done unintentionally and does not aim to gain personal gain (Zimbelman et al., 2017). Furthermore, Zimbelman et al. (2017) stated that intentional errors/ fraud that were not disclosed could have a detrimental effect on the financial reporting process itself. Therefore, the company's/ government's financial statements need to be examined by an independent party from outside the company, commonly called an auditor, which aims to provide reasonable assurance that the government's/company's financial statements have been protected from material misstatement, either intentional misstatement/ fraud or unintentional misstatements (Sudaryanto et al., 2022; Tjaraka et al., 2022; Utari, Iswoyo et al., 2021). Therefore, the task of an auditor is to provide assurance to interested parties that the financial statements have been prepared according to applicable standards and reflect the actual situation of a business entity.

The phenomenon that occurred in the report on the results of the examination of the regional government financial reports of East Java Province for the 2020 fiscal year, which obtained the results: Unqualified Opinion. In the report, there are many findings/ notes that need to be considered by the East Java Provincial government. The findings/records of Audit Board still finds weaknesses in internal control and problems related to non-compliance with laws and regulations, which do not materially affect the fairness of the presentation of Financial Statements for fiscal year 2020. Furthermore, other Audit Board findings/notes: (1) accountability for grant expenditures is incomplete. Such as spending on grants for street lighting assistance to community groups which are indicated to be carried out not according to the Regional Grant Agreement, namely overpayments for non-conformances in specifications and price overruns, (2) control over the implementation of Grant Expenditures in the form of unaccountable money and shortages volume of work at the Public Works Department of Highways. If Audit Board 's findings are not immediately followed up, it could indicate fraud.

Attribution theory was first developed by Fritz Heider 1958 in (Weiner, 2008). This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade (Rachmawati, 2019). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, 2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

Fraud can be carried out in various ways, starting from the findings of Audit Board in examining government financial statements which are seen from four things, namely: (1) the fairness of the presentation of financial statement items in accordance with Government Accounting Standards, (2) adequacy of disclosure, (3) compliance with the provisions of laws and regulations, (4) effectiveness of the internal control system. Therefore, the auditor's ability to detect findings/frauds must continue to be improved. This is because each auditor as an individual has different limitations, so the level of ability to detect findings/frauds must also be different. The limitations of the auditor can lead to a gap or expectation gap between users of auditor services (Anggriawan, 2014); Aliyyah et al. (2021); Prasetyo et al., 2021). Elfia and NR (2022) shows that auditor training has a positive effect on the auditor's ability to detect fraud, while time pressure and professional skepticism have no effect on the auditor's ability to detect fraud. Therefore, auditors are advised to attend training more often so that their ability to detect fraud will also improve. Several research results state that several factors can affect the auditor's ability to detect fraud. These factors include: (1) auditor experience, (2) implementation of ethical rules, (3) skepticism. Nurwahyuni and Isnawati (2021); Endarto et al. (2021); M. M. Indrawati et al., 2021) shows that the work experience of auditors has a significant effect on the ability to detect financial statement fraud, the professional skepticism of auditors has a significant effect on the ability to detect financial statement fraud, and professional ethics has a significant effect on the ability to detect financial statement fraud. Based on the description above, this study aims to test and analyze the determinants of the Auditor's Ability to Detect Fraud in Financial Statements.

2. Literature review and hypothesis development

2.1. Attribution theory

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021; Rachmawati, 2019; Utari, Iswoyo et al., 2021). Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Abadi et al., 2021; Endarto, Taufiqurrahman, Indriastuty et al., 2021; Robbins & Judge, 2013). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization.

2.2. Personality type theory

Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in (Sample & Sample, 2017; Aliyyah, Prasetyo et al., 2021; Prasetyo, Aliyyah, Rusdiyanto, Prasetyo, Aliyyah, Rusdiyanto, Kalbuana, Rochman et al., 2021) namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions

120

125

(Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

2.3. Conceptual framework

This study aims to examine the effect of auditor's experience, auditor ethics, professional skepticism, and personality type of auditors on Auditor's ability to detect fraud. the conceptual framework of this research as follows:

2.4. Hypothesis development

2.4.1. The effect of auditor experience on fraud detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in (Kalbuana, Prasetyo et al., 2021; Rachmawati, 2019; Rusdiyanto et al., 2021). Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Faradina (2016, 2021, 2021) states that audit experience is an experience gained from the length or number of tasks that have been handled by the auditor. Auditors who have a lot of experience will have the ability to find fraud that occurs in the company and can provide a better explanation than auditors who have no or little experience. In addition, the more auditors perform audits of financial statements, the higher the level of professional skepticism owned by the auditors. Without skepticism, even experienced auditors may not necessarily be able to find fraud in the company. The results of research conducted Kartikarini and Sugiarto (2016); Febriansyah and Novitasari (2021); Lismawati, Sari and Ismalia (2021); Helmiati and Helmiati (2021) that auditors experience has a positive effect on fraud detection. These results indicate that the auditor must have good audit experience when conducting an audit. Auditors who have a lot of experience can find out various audit problems in more depth, besides that auditors will find it easier to follow increasingly complex developments. Based on the description above, the following hypothesis is formulated:

AQ8 Figure 1. Conceptual framework.

H1: Auditor experience has a positive effect on detection Fraud

160

2.4.2. The effects of auditor ethics on fraud detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021; Prasetyo, Endarti et al., 2021; Robbins & Judge, 2013). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in (Sample & Sample, 2017; (Prasetyo et al., 2021b; Prasetyo, Aliyyah, Rusdiyanto, Syahrial et al., 2021), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

165

170

AQ10

175

Ethics is basically related to morals that become the guide for a person or a group of nature to regulate their behavior, as well as benchmarks in assessing the goodness or badness of an action. An auditor must comply with ethical rules in carrying out his duties to facilitate the auditor in detecting fraud (Gusti & Ali, 2008; Prabowo et al., 2020; Susanto et al., 2021). The results of the study (Hassan, 2019; Helmiati & Helmiati, 2021; Pipaldi et al., 2018), show that auditor ethics has a positive effect on fraud detection. This shows that if an auditor follows the regulated professional ethics, it will guarantee the quality and increase the ability to detect fraud owned by the auditor. Khadilah et al. (2020, Rusdiyanto, Agustia et al., 2020, Rusdiyanto, Hidayat et al., 2020) stated that the application of ethical rules owned by an auditor has an effect on quality audit results. The quality of the financial statements audited by an auditor is influenced by the ethical application of an auditor. Detection of fraud in the audit of the company's financial statements requires the auditor to have ethics, because ethical auditors have integrity and objectivity in carrying out their work. Nurwahyuni & Isnawati, 2021; Yuhertiana, Arief et al., 2020, Yuhertiana et al., 2022) states that the application of ethical rules is defined as principles, rules, and moral values that are applied to regulate the behavior of an auditor in carrying out his duties. The SPKN lists three values that must be upheld by Audit Board of the Republic of Indonesia members, namely independence, integrity, and professionalism. Khadilah et al. (2015, 2020, 2020) stated that the ethics of the auditor when auditing reports can affect audit results to be of higher quality. The quality of the audited financial statements can be influenced by the ethics of the auditor.

180

185

AQ11

195

With the application of ethical rules, it is hoped that the auditor can uphold a professional attitude in carrying out his duties and comply with the applicable professional code of ethics so that the possibility of fraud by the auditor does not occur. Based on the description above, the following hypothesis is formulated:

200

H2: The application of ethical rules has a positive effect on detection Fraud

2.4.3. The effect of professional skepticism on fraud detection

Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016; Juanamasta et al., 2019). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature,

205

character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure, situations, difficulties or luck in work kade, in (Rachmawati, 2019; Yuhertiana, Bastian et al., 2019; Yuhertiana, Patrioty et al., 2019). Yusuf and Nurihsan, (2008:74; Rahma et al., 2016; Tatiana & Yuhertiana, 2014) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers.

Trinanda and Waluyo (2016; Yuhertiana, 2011b, 2011a) states that the higher the professional skepticism of an auditor, the less likely it is that fraud will occur. Professional skills require auditors to exercise professional skepticism, namely an attitude that includes a questioning mind and an objective evaluation of the adequacy, competence, and relevance of evidence (Audit Board of the Republic of Indonesia Regulation No. 1 of 2007). Professional Standards for Certified Public Accountants explain that professional skepticism is an attitude that always questions and evaluates audit evidence critically. Umri and Islahuddin (2022, 2021, 2015) states that the high attitude of skepticism owned by the auditor results in greater fraud that will be detected. Kartikarini and Sugiarto (2021, 2021, 2016) shows the same result, namely that the attitude of professional skepticism has a positive influence on the ability of an auditor to detect fraud. The higher the attitude of professional skepticism that the auditor has, the more willingness or desire to find out the signs of fraud around him.

Fullerton and Durtschi (2011, 2019, 2020) found that auditors with high skepticism will increase their ability to detect it by developing additional information searches when faced with symptoms of fraud. This finding is supported by research conducted by Faradina (2016, 2016). An auditor is required to have an attitude of professional skepticism in carrying out his audit duties, especially for the possibility of fraud even though the fraud will not necessarily occur. Auditors who have a skeptical attitude will not immediately believe the assertions given by management. Auditors will always look for additional information and evidence that can be used to support management's assertions. Auditors who have an attitude of professional skepticism in making decisions and providing opinions will be more careful, the auditor will also seek additional information and evidence to ensure that the audited financial statements are free from all forms of misstatement. The results of research conducted by (Helmiati & Helmiati, 2021; Lismawati, Sari & Ismalia, 2021; Nurwahyuni & Isnawati, 2021) also found evidence that professional skepticism has a positive effect on an auditor's ability to detect fraud, because the higher the skepticism of an auditor, the higher the level of auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated:

H3: Professional Skepticism has a Positive Effect on Fraud Detection

2.4.4. The effect of personality type auditors on fraud detection

Behavior that is caused internally is behavior that is believed to be under the personal control of the individual concerned while behavior externally is seen as the result of external causes that force the individual to behave (Asyik et al., 2022; Robbins & Judge, 2013; Wahidahwati & Ardini, 2021). The discussion of this attribution theory leads to the factors causing the occurrence of an event or events. Researchers use this attribution theory to find out what factors influence the auditor when doing an assignment, especially on the personal quality of the auditor itself. In this study, the quality of personal auditors is measured by the level of professional skepticism, ethical conduct, and experience that have an impact on the quality of their work in the organization. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in (Adi et al., 2022; Sample & Sample, 2017; Sudaryanto et al., 2022), namely: 1. The way a person focuses their

attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving) 260

Personality types are included in internal forces, namely factors that come from within a person or individual whose abilities can personally influence their performance and behavior, so that the auditor's personality type can influence the auditor's behavior in acting. Determination of personality type in this study using the Myers Briggs Type Indicator which introduces 16 types of a person's personality which is a combination of four pairs of human preferences. Robbins and Judge (2013, Sudaryanto et al., 2021, Utari, Sudaryanto et al., 2021) suggest that a person's personality type can influence the decision making. (Kusumawaty & Betri, 2019; Kartikarini & Sugiarto, 2016; Rudy et al 2017) shows personality types positively influence to financial report fraud. 265 AQ12 270

Noviyanti (2008, 2017) found that auditors with Sense and Thinking and Intuition and Thinking personality types are auditors who have higher professional skepticism than auditors with other personality types. Personality with a combination type of Sense and Thinking and Intuition and Thinking is a type that tends to be logical in making decisions because it considers the facts. The combination type of NT tends to emphasize patterns, contexts, and relationships with dubious and inconclusive data where in these conditions the auditor is required to guess the meaning of the data intuitively, and then use it as a basis for digging up facts with logic and objective analysis and critical in situations where decisions must be made (Tuanakotta, 2013; Hanim et al., 2019; Sudaryanto et al., 2020). In the context of auditing, fraud is generally systematic or has a pattern, sometimes it is not convincing, so that to explore it, an objective and critical logic of analysis is needed. Based on this concept, it is suspected that there is an influence of the NT combination personality type that exists in the auditor on the auditor's ability to detect fraud. Based on the description above, the following hypothesis is formulated: 275 280

H4: Personality Type Auditors has a Positive Effect on Fraud Detection 285

3. Research method

3.1. Research sample

The research population is 156 Audit Board of the Republic of Indonesia auditors spread across various regional entities in East Java Province which has 38 district/city governments and 1 provincial government. The sampling technique used is by using a non-probability sampling approach, namely a sampling technique that does not provide equal opportunities for each part of the population to be used as research samples (Sugiyono, 2014; Putri & Sudaryanto, 2018; Sudaryanto et al., 2019). In addition, the sample uses the Convenience Sampling technique, which is choosing a sample from population elements (people or events) whose data is easy to obtain. This sampling method was chosen based on the difficulty of the auditor's willingness to be used as a research sample. analysis technique using multiple linear regression with SPSS software which is used to analyze the data in this study. One of the regression solving procedures, SPSS has a high degree of flexibility in research that relates theories, concepts, and data that can be done to the variables in the study. 290 AQ13 295

3.2. Variable operational definition

 300

3.2.1. Auditor experience

Experience is a real activity that has been carried out by the auditor where audit experience is seen from the length of time the auditor has worked. Auditor experience in work can expand work

ability. The more often a person does the same job, the more skilled and faster he gets the job done. The more kinds of work a person does, the more complex and extensive his work experience will be, and it allows for increased performance (Simanjuntak et al. (2015). In this study, the indicators used to measure the work experience variable from the research of Sukriyah and Inapty (2009), namely length of work, number of examination tasks, and adjusted for the addition of indicators from Agustin (2013), namely work ability, and task intensity and career development. Responses from respondents are determined on a scale of 1 to 5.

3.2.2. Auditor ethics

The application of ethical rules for auditors consists of principles, rules, and moral values, which are applied and must be adhered to in regulating the behavior of an auditor in carrying out their duties. The profession as an auditor is required to uphold professional ethics because auditors have responsibilities to various parties, including responsibility for the auditee, responsibility for the government, and responsibility for the community (Nurwiyati, 2015). By applying these ethical rules, it is hoped that an auditor will be able to uphold a professional attitude and comply with the applicable professional code of ethics so that the possibility of fraud that may be carried out by the auditor will not occur. The study used three indicators of Audit Board of the Republic of Indonesia code of ethics which included integrity, professionalism and was also adjusted by adding indicators from Sukriyah and Inapty (2009) namely independence. Responses from respondents were determined using a Likert scale of 1 to 5.

3.2.3. Professional skepticism

Professional Skepticism is an attitude that should be owned by an auditor which balances suspicion and trust. In ISA No. 200, it is said that the attitude of professional skepticism is that the auditor makes a critical assessment, with a questioning mind on the validity of the evidence obtained, is wary of the audit evidence that the auditor has obtained, is alert to audit evidence that is contradictory or contradictory. raises questions regarding reliability and documents, and also responds with questions and other information obtained from management and related parties (IFAC, 2004). Professional skepticism is measured using indicators that have been developed by Agustin (2013), namely critical thinking, professionalism, assumptions, accuracy, accuracy in examining the client's financial statements, understanding of audit evidence, and also adjusted for the addition of indicator, namely attitude. Responses from respondents are determined by a Likert scale of 1 to 5.

3.2.4. Personality type

Personality is defined by Gordon Allport in (Noviyanti, 2008) as an organic organization within the individual who has a psychological system that determines his unique adjustment to his environment. Thus, personality type is a person's adjustment to the environment according to his way. In other words, personality is the unique ways that individuals react to and interact with others. In this study, a person's personality type was measured using the Myers Briggs Type Indicator. The indicator for the personality type variable consists of 40 question items developed by Nasution and Fitriany (2012); Mudrika (2011). Of the 40 statement items contained in the questionnaire, 5 statement items describe each preference. The auditor is asked to choose one of the two contradictory statements between 4 pairs of preferences that correspond to the auditor's personality type. Auditors with Sensing-Thinking and Intuition-Thinking personality types were given a score of 1, and auditors with other personality types were given a score of 0.

3.2.5. Fraud detection

Fraud detection is a process to be able to find or disclose deviant actions that are carried out intentionally and result in misstatement of a financial statement. Fraud detection includes the identification of fraud indicators that require follow-up by the auditor to conduct an investigation. Fraud detection in this study was measured using indicators from Koroy (2008) developed by Simanjuntak et al. (2015) where the indicators of fraud detection are understanding the internal control system, characteristics of fraud, audit environment, audit methods, forms of fraud, and

testing documentation. and personal. Responses from respondents are determined by a Likert scale of 1 to 5. 355

3.3. Data analysis technique

3.3.1. Validity test and reliability test

The data obtained from the questionnaire was tested to ensure the research data was valid and reliable.

3.3.2. Classic assumption test 360

The classical assumption tests carried out in this study were the normality test, the multicollinearity test, and the heteroscedasticity test.

3.3.3. Hypothesis test

Multiple linear regression analysis is used to determine the effect of more than one independent variable with the dependent variable (Sugiyono, 2014). This study examines the effect of auditor experience, auditor ethics, professional skepticism and auditor personality type affect the auditor's ability to detect fraud. The formula used is as follows: 365

$$PK = a + b1PA + b2PAE + b3SP + b4TK + e$$

4. Result and discussion

4.1. Descriptive statistics 370

Variable descriptive statistical tests to provide an overview of the average (mean), standard deviation, minimum value, maximum value, and number of studies are presented as follows:

The table output variables Auditors experience above shows the number of observations (N) was 57. From these 57 observations, the Auditors experience value minimum was .32, and the Auditors experience value maximum was 54, the mean value of 57 observations or the mean was of 45,16 with a standard deviation of 4,71. The table output variables Auditor ethics above shows the number of observations (N) was 57. From these 57 observations, the Auditor ethics value minimum was .33, and the Auditor ethics value maximum was 50, the mean value of 57 observations or the mean was of 43,70 with a standard deviation of 4,58. The table output variables Professional sceptism above shows the number of observations (N) was 57. From these 57 observations, the Professional sceptism value minimum was .37, and the Professional sceptism value maximum was 50, the mean value of 57 observations or the mean was of 44,07 with a standard deviation of 4,35. The table output variables Auditor personality type above shows the number of observations (N) was 57. From these 57 observations, the Auditor personality type value minimum was .42, and the Auditor personality type value maximum was 60, the mean value of 57 observations or the mean was of 51,75 with a standard deviation of 5,13. 385

4.2. Data validity test

The validity of the data was tested using the Pearson Correlation test. The following is a validity test:

The results of the validity test it is known that all values of r arithmetic $>$ r table (r table is obtained from the formula $n-2$, $= 57-2 = 55$ and $df (n-2) = 0.05$) then the value of r count (55;0.05) is 0.260. The table above shows that from all questions on each variable the value of r is calculated $>$ 0.260. So it is declared valid. 390

4.3. Reliability test

For reliability testing is carried out to determine whether the results of this questionnaire can be trusted or reliable. The following is a reliability test: 395

From the results of the reliability test, it is known that the Cronbrach's Alpha value of auditor experience is 0.840, the Cronbrach's Alpha value of the application of ethical rules is 0.927, the Cronbrach's Alpha value of professional skepticism is 0.943, the Cronbrach's Alpha value of fraud detection is 0.942. So it can be concluded that for all variables in this study have a value greater than 0.60 then it can be declared reliable. 400

4.4. Classic assumption test

4.4.1. Normality test

This normality test uses the Kolmogrof-Smirnof test, from this test it can be seen that the residual distribution is normal or not. The following is a normality test: 405

Based on the Kolmogrov-Smirnov test, it has a significance value $>$ 0.05 (5%), the conclusion is that all data are normal.

4.4.2. Multicollinearity test

Multicollinearity testing is done by looking at the VIF and Tolerance numbers. The following is a multicollinearity test: 410

The results of the multicollinearity test show that the value for tolerance is > 0.1 and $VIF < 10$. So it can be said that the data in this study is free from multicollinearity. This means that there is no correlation between the independent variables in this study.

4.4.3. Heteroscedasticity test

The heteroscedasticity test assesses whether there is an inequality of variance for all residual observations from one observation to another. 415

Based on the glejser test, it can be seen that the four variables, namely auditor experience, application of ethical rules, professional skepticism, and personality type have a Sig value > 0.05 , so it can be concluded that there is no heteroscedasticity.

4.4.4. Multiple linear regression analysis

The results of the multiple linear regression test that can be seen in table 11 are used as a basis for determining the behavior of the regression model using the F test, determining the coefficient of determination by looking at the value of R square/Adjusted R square and testing the hypothesis by looking at the significance value. 420

4.4.5. Goodness of fit

Goodness of fit is used to determine whether this research model is fit. In other words, Goodness of fit states the level of suitability (fit) of the research model with the ideal model for that research. Based on the table above, it shows that the test value of $F = 60.651$, with a significance level of 0.000 less than 0.05, the regression model is said to be appropriate. This shows that the regression model of this study is in accordance with the ideal model. 425 430

4.4.6. Coefficient of determination test results (R^2)

The coefficient of determination test is used to measure how far the model's ability to explain the variation of the dependent variable is. The table above shows that the Adjusted R coefficient value is 0.810, which means that 81.0% of the fraud detection variables are influenced by the auditor's experience, application of ethical rules, personality type, and professional skepticism while the remaining 19.0% is influenced by other factors that are not included in this research model. 435

4.5. Discussion of research results

4.5.1. Findings the effect of auditor experience on fraud detection

The findings of Hypothesis 1 prove that the auditor's experience has a positive effect on fraud detection. The table above shows that the significance value is $0.00 < 0.05$ (5%), so the hypothesis (H1) is accepted, supported by the hypothesis proposed **Auditor experience has a positive effect on fraud detection**. The direction of the coefficient which is positive indicates that the more experienced an auditor is, the better the auditor's ability to detect fraud that occurs. The results of this study support the research of (Kartikarini & Sugiarto, 2016); Febriansyah and Novitasari (2021); Lismawati, Sari and Ismalia (2021); Helmiati and Helmiati (2021); Faradina (2016); Arnanda et al. (2022) which also found evidence that auditor experience has a positive effect on fraud detection. 440 445

Experienced auditors will show a higher level of selective attention to relevant audit information and evidence (Hobson et al., 2015; Jaffar et al., 2011; Pratiwi et al., 2019; Suryandari & Yuesti, 2017). The experience referred to is the experience of the auditor in conducting audits of financial statements and audit assignments in the field, both in terms of the length of time, as well as the number of audit assignments that have been carried out. (Suraida, 2005) states that in conducting 450

an audit of financial statements, both in terms of the length of time and the number of assignments that have been handled, that the more audit experience an auditor has, the more able to produce various kinds of audits. This research is supported by research by Arsendy et al. (2017); Adyani (2014) finding evidence that auditor experience has a positive effect on auditors' ability to detect fraud. Experienced auditors are not enough to be able to detect fraud, auditors, an auditor must also comply with the implementation of ethical rules. Several previous studies in various countries have also stated that auditor experience has a positive influence on fraud detection and audit quality (Al-Ebel et al., 2020; Azza & Gaballa, 2011; Kuntari et al., 2017). In Yemen, audit quality and fraud prevention cannot be separated from the spiritual perception of each auditor. In several other studies, the educational experience of auditors has no effect on audit quality in both Libya and Turkey (Daoust & Malsch, 2019; Ocak & Ntim, 2018). However, the experience gained from abroad provides added value for the auditor (Hou et al., 2020).

These findings are supported by Attribution Theory and Personality Type Theory, Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in (Rachmawati, 2019). while the Personality Type Theory explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, (2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

4.5.2. Findings the effects of auditor ethics on fraud detection

The findings of Hypothesis 2 prove that auditor ethics has a positive effect on fraud detection. The results from the table above show a significance value of $0.030 < 0.05$ (5%), so that the hypothesis (H2) is accepted, supported by the initial hypothesis proposed: **The application of ethical rules has a positive effect on fraud detection.** The more obedient auditors to ethical rules, especially those written (professional code of ethics), the easier it will be for auditors to detect fraud. The results of this study are in line with the results of research conducted by Pipaldi et al. (2018); Hassan (2019); Helmiati and Helmiati (2021) which also found evidence that the application of ethical rules has a positive effect on fraud detection.

Professional Ethics are norms that must be adhered to by every member of the State Audit Board as State Examiner while carrying out their duties to maintain their dignity, honor, image, and credibility. Trinanda and Waluyo (2016) found evidence that professional ethics affect the ability of auditors to detect fraud. The results of research analysis Helmiati and Helmiati (2021) shows that auditor ethics has a positive and significant effect on fraud detection. Other studies also mention that auditor ethics greatly affects audit quality, including finding fraud (Haeridistia & Agustin, 2019; Kuntari et al., 2017).

These findings are supported by Attribution Theory and Personality Type Theory, Attribution theory was first developed by Fritz Heider in 1958. This theory refers to how a person interprets an event and the causes of his behavior (Luthans, 1998 in Tandiontong, 2016). Fritz Heider stated

that a person's behavior is determined by internal forces and external forces. A person's performance and behavior can be influenced by his personal abilities that come from the internal strength possessed by a person, for example, such as nature, character, attitude, ability, expertise and effort, while factors originating outside the individual's control are a person's external strength such as pressure. situations, difficulties or luck in work kade, in (Rachmawati, 2019). while the Personality Type Theory explains Yusuf and Nurihsan, (2008:74) states that personality is all real thoughts, feelings, and behaviors both consciously and unconsciously. In his book "Psychological Type", Jung developed a basic personality indicator, namely the Myers-Briggs Type Indicator. The Myers-Briggs Type Indicator is a measuring tool for distinguishing a person's personality that was discovered by Katherine C. Briggs and Isabel Briggs Myers. In the Myers-Briggs Type Indicator, a person's personality preference indicators are distinguished based on 4 pairs of preferences that will produce 16 personality types as cited in Sample & Sample, (2017), namely: 1. The way a person focuses their attention and gains energy (Extroversion or Introversion), 2. The way a person retrieves information (Sensing or Intuition), 3. The way a person makes decisions (Thinking or Feeling), 4. The way a person adapts to the environment and the way they accept and evaluate things (Judging or Perceiving)

4.5.3. Findings the effect of professional skepticism on fraud detection

The findings Hypothesis 3 proves that professional skepticism has a positive effect on fraud detection. Results The table above shows a significance value of $0.000 < 0.05$ (5%), the hypothesis (H3) is accepted, the findings are supported by the hypothesis proposed Professional Skepticism has a Positive Effect on Fraud Detection. The direction of the positive coefficient indicates that the more skeptical Auditor will be able to detect fraud at the audit planning stage, and will carry out the detection at the next audit stage. The results of this study are in line with the results of research conducted by Simanjuntak et al. (2015); Fullerton and Durtschi (2011); Biksa dan wiranata (2016); Faradina (2016), Rachmawati (2019), Nurwahyuni and Isnawati (2021), and Febriansyah and Novitasari (2021) which found evidence that professional skepticism has an effect on against fraud detection. An audit designed with high professional skepticism will be able to provide adequate assurance to detect fraudulent financial statements or errors in financial statements. In other words, the attitude of professional skepticism can assist the auditor in evaluating evidence by conducting audit tests to obtain assurance that there may be symptoms of fraud that will occur.

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti & Res, Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al. (2018); L. Indrawati et al. (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

4.5.4. Findings the effect of personality type auditors on fraud detection

The findings of Hypothesis 4, the auditor's personality type has a positive effect on fraud detection. The table above shows a significance value of $0.021 < 0.05$ (5%), then the hypothesis (H4) is accepted. The findings are supported by the hypothesis proposed **Personality Type Auditors has a Positive Effect on Fraud Detection**. The direction of the positive coefficient indicates that the better the personality type of the auditor, the easier it is to detect fraud. In this study, personality types were determined using the MBTI with 4 pairs of preferences, namely: 1) Extravert (E) and Introverted (I); 2) Sensing (S) and Intuition (N); 3) Thinking (T) and Feeling (F); 4) Judging (J) and Perceiving (P). Auditors with a combination of ST and NT personality types are auditors who tend to think logically in making decisions and will consider all available facts to support their decisions.

Individuals with the ST personality type process information and make decisions based on the facts obtained by using logical analysis. Meanwhile, NT processes information based on the possibilities that occur and considers them theoretically and scientifically in making decisions. The results of this study support research conducted by Kartikarini and Sugiarto (2016), Suryanto et al. (2017), Robbins and Judge (2013), and Kusumawaty and Betri (2019) which state that personality type has a positive effect on fraud detection.

Personality type also one of the factor that influences an auditor in detecting financial statements (Indrasti et al., 2019; Umar et al., 2019). To detect fraud, an auditor also needs to have a personality type. Personality is a person's behavior when interacting with other people. Auditors who have a certain personality are easier to detect fraud. The personality types that are easier to detect fraud are auditors with ST and NT personalities compared to SF and NF personality types. This is because auditors who have a personality type with good senses can find fraud in the company. The ability of the auditor to detect fraud will have an impact on the provision of an opinion on the audit results. To improve its ability, the auditor must know and understand fraud, both of its kind, the characteristics of fraud and how to detect the fraud (Simanjuntak et al., 2015).

With regard to audit evidence, an auditor must have a high attitude of professional skepticism (Indrasti & Res; Ruth et al., 2021). Professional skepticism is defined as an auditor's attitude which includes an attitude that always questions and evaluates audit evidence critically or other matters during the audit (State Financial Auditing Standard, 2017). The auditor must have an attitude of professional skepticism in evaluating and collecting audit evidence, especially those related to the assignment to detect fraud that has occurred Sari et al. (2018); L. Indrawati et al. (2019) found evidence that professional skepticism has a positive effect on fraud detection. Skepticism expresses the auditor's alertness to conditions that can be indicated as misstatements so that the importance of assessing audit evidence is important. Therefore, State Finance No. 01 paragraph 30 (2007) requires auditors to have professional skepticism.

5. Conclusion

Based on the results of the analysis and discussion, it can be concluded that the auditor's experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud, meaning that the higher and lower the auditor's experience, meaning that the higher and lower the auditor's ethics, professional skepticism, and the type of auditor's ethics. personality has an impact on increasing and decreasing the ability of auditors to detect fraud. The findings are empirically supported by attribution theory and personality type theory, attribution theory explains that how a person interprets an event that causes a person's behavior is determined by internal forces while personality type theory explains that personality is all real thoughts, feelings, and behaviors that are both realized and realized. or unconsciously. The findings empirically have implications for government and company policies by looking at these findings which explain that auditor experience, auditor ethics, professional skepticism, and personality type have a positive effect on the auditor's ability to detect fraud. This study has limitations that cannot be avoided. Disclosure of limitations aims to make this research understandable with a non-misleading interpretation. In addition, the disclosure of limitations also has the aim that further research can fill the blank space which is the limitation of this study. First, the research sample was only the auditors of the Financial Supervisory Board of East Java Province, so the generalization of the results of this study is still quite weak. Therefore, further research needs to expand the scope of the research sample in order to get better and wider research results. Second, this study develops a questionnaire model with questions and statements, so that there is a possibility of bias when respondents answer the questionnaire. Therefore, further research is expected to be able to develop a questionnaire using case examples. Finally, further research is expected to develop this research by looking for other factors to detect fraud such as workload, auditor independence, time budget pressure and audit risk.

DEFINITION

1. Your Article is defined as comprising (a) your Accepted Manuscript (AM) in its final form; (b) the final, definitive, and citable Version of Record (VoR) including the abstract, text, bibliography, and all accompanying tables, illustrations, data, and media; and (c) any supplemental material hosted by Taylor & Francis. This licence and these Terms & Conditions constitute the entire agreement and the sole understanding between you and us ('agreement'); no amendment, addendum, or other communication will be taken into account when interpreting your and our rights and obligations under this agreement, unless amended by a written document signed by both of us.

TAYLOR & FRANCIS' RESPONSIBILITIES

2. If deemed acceptable by the Editors of the Journal, we shall prepare and publish your Article in the Journal. We may post your Accepted Manuscript as free-to-access in advance of the formal publication of the Version of Record (VoR). We shall publish the VoR in the Journal on an Open Access basis, viz., to be made freely available online with no subscription fee or Article-pay-to-view fee or any other form of access fee or any publication embargo being applied. We reserve the right to make such editorial changes as may be necessary to make the Article suitable for publication or as we reasonably consider necessary to avoid infringing third-party rights or breaching any laws; and we reserve the right not to proceed with publication for whatever reason.
3. If before publication we reasonably consider that the Article should not be published, on the advice of our legal advisors, we may decline to publish the Article, in which case we will refund you any Article Publishing Charge you have paid.
4. If after publication we reasonably consider that the Article should be retracted or removed from our website, on the advice of our legal advisors, for example, because of a breach in your Author Warranties, we may retract and withdraw it, and in such case shall be under no obligation to refund you any Article Publishing Charge you have paid.
5. You hereby expressly grant us the right to bring an action for infringement of copyright in relation to your Article as defined above pursuant to section 101A of the Copyright, Designs and Patents Act 1988 (as amended from time to time) and any other equivalent legislation as may exist in other territories.
6. If we do not receive payment of the applicable Article Publishing Charge after six (6) weeks, we reserve the right to rescind the Open Access status of your Article and to publish it on an alternative licence basis.

YOUR RIGHTS AS AUTHOR

7. These rights are personal to you, and your co-authors, and cannot be transferred by you to anyone else. You assert and retain the following rights as author(s):
 - i. The right to re-use your own work on a commercial or non-commercial basis, and in any way permitted under the [Creative Commons Attribution License](#) (CC BY), including but not limited to, translation, adaptation, and resale.
 - ii. The right to be identified as the author of your Article, whenever and wherever the Article is published, such rights including moral rights arising under § 77, Copyright, Designs & Patents Act 1988, and, so far as is legally possible, any corresponding rights we may have in any territory of the world.
 - iii. The right to retain patent rights, trademark rights, or rights to any process, product or procedure described in your Article.
 - iv. The right to post and maintain at any time your 'Author's Original Manuscript (AOM), i.e., the unpublished version of the Article created by you prior to peer review; and the Article in its published form as supplied by us as a [digital eprint](#) on your own website for personal or professional use, or on your institution's network or intranet or website, or in a subject repository or network, with the acknowledgement: 'The Version of Record of this manuscript has been published and is freely available in <JOURNAL TITLE> <date of publication> <http://www.tandfonline.com/> <Article DOI>.

WARRANTIES MADE BY YOU AS AUTHOR

8. You warrant that:
 - i. All persons who have a reasonable claim to authorship are named in the Article as co-authors including yourself, and you have not fabricated or misappropriated anyone's identity, including your own.
 - ii. You have been authorized by all such co-authors to sign this agreement as agent on their behalf, and to agree on their behalf the priority of the assertion of copyright and the order of names in the publication of the Article.
 - iii. The Article is your original work, apart from any permitted third-party copyright material you include, and does not infringe any intellectual property rights of any other person or entity and cannot be construed as plagiarizing any other published work, including your own published work.
 - iv. The Article is not currently under submission to, nor is under consideration by, nor has been accepted by any other journal or publication, nor has been previously published by any other journal or publication, nor has been assigned or licensed by you to any third party.
 - v. The Article contains no content that is abusive, defamatory, libelous, obscene, fraudulent, nor in any way infringes the rights of others, nor is in any other way unlawful or in violation of applicable laws.
 - vi. Research reported in the Article has been conducted in an ethical and responsible manner, in full compliance with all relevant codes of experimentation and legislation. All Articles which report in vivo experiments or clinical trials on humans or animals must include a written statement in the Methods section that such work was conducted with the formal approval of the local human subject or animal care committees, and that clinical trials have been registered as applicable legislation requires.
 - vii. Any patient, service user, or participant (or that person's parent or legal guardian) in any research or clinical experiment or study who is described in the Article has given written consent to the inclusion of material, text or image, pertaining to themselves, and that they acknowledge that they cannot be identified via the Article and that you have anonymized them and that you do not identify them in any way. Where such a person is deceased, you warrant you have obtained the written consent of the deceased person's family or estate.
 - viii. You have complied with all mandatory laboratory health and safety procedures in the course of conducting any experimental

work reported in your Article; your Article contains all appropriate warnings concerning any specific and particular hazards that may be involved in carrying out experiments or procedures described in the Article or involved in instructions, materials, or formulae in the Article; your Article includes explicitly relevant safety precautions; and cites, if an accepted Standard or Code of Practice is relevant, a reference to the relevant Standard or Code.

- ix. You have acknowledged all sources of research funding, as required by your research funder, and disclosed any financial interest or benefit you have arising from the direct applications of your research.
- x. You have obtained the [necessary written permission](#) to include material in your Article that is owned and held in copyright by a third party, which shall include but is not limited to any proprietary text, illustration, table, or other material, including data, audio, video, film stills, screenshots, musical notation and any supplemental material.
- xi. You have read and complied with our policy on [publishing ethics](#).
- xii. You have read and complied with the Journal's Instructions for Authors.
- xiii. You will keep us and our affiliates indemnified in full against all loss, damages, injury, costs and expenses (including legal and other professional fees and expenses) awarded against or incurred or paid by us as a result of your breach of the warranties given in this agreement.
- xiv. You consent to allowing us to use your Article for marketing and promotional purposes.

GOVERNING LAW

9. This agreement (and any dispute, proceeding, claim or controversy in relation to it) is subject to English law and the parties hereby submit to the exclusive jurisdiction of the Courts of England and Wales.
